Platina is with difficulty oxidized; hence it is of great use in chemical instruments, for crucibles, to tip the blow-pipe, &c. and for conducting the galvanic fluid. It is also employed for the touch-holes of guns. The following is Dr. Wollaston's method of drawing very fine wire of this metal: Platina is stretched in the centre of a mould, and the mould filled with silver; the silver is then drawn out into a fine wire, and of course the platinum with it; the wire is then put into nitric acid, which dissolves the silver, but does not act upon the platina: the central wire of platina is thus left in a state of extreme fineness.

Platina may be made to form a fine coat over other metals, by dissolving it in aqua-regia, and adding ether to the solution, which combines with a portion of the platina, and swims above the surface of the acid solution; this is to be applied to the substance to be coated, then washed in water, to free it entirely from acid, and carefully dried.

It has also been proposed to be used in enamel painting, instead of silver, which is apt to tarnish; and various coloured alloys may be produced, by combining it with different proportions of gold, which may be applied to many purposes.

PLATING, is the art of covering baser metals with a thin plate of silver, either for use, or for ornament. It is said to have been invented by a spur-maker, not for show, but for real utility. Till then the more elegant spurs in common use were made of solid silver; and from the flexibility of that metal, they were liable to be bent into inconvenient forms by the slightest accident. To remedy this defect, a workman at Birmingham contrived to make the branches of a pair of spurs hollow, and to fill that hollow with a slender rod of steel or iron. Finding this a great improvement, and being desirous to add cheapness to utility, he continued to make the hollow larger, and of course the iron thicker and thicker, till at last he discovered the means of coating an iron spur with silver in such a manner, as to make it equally elegant with those which were made wholly of that metal. The invention was quickly applied to other purposes; and to numberless utensils, which were formerly made of brass or iron, are now given the strength of these metals, and the elegance of silver, for a small additional expense.

The silver plate was formerly made to adhere to the baser metal by means of solder; which is of two kinds, the soft, and the hard, or the tin, and silver, solders. The former of these consists of tin alone, the latter generally of three parts of silver, and one of brass. When a buckle, for instance, is to be plated by means of the soft solder, the ring, before it is bent, is first tinned, and then the silver-plate is gently hammered upon it, the hammer employed being always covered with a piece of cloth. The silver now forms, as it were, a mould to the ring, and whatever of it is not intended to be used, is cut off. This mould is fastened to the ring of the buckle by two or three cramps of iron wire; after which the buckle, with the plated side undermost, is laid upon a plate of iron sufficiently hot to melt the tin, but not the silver. The buckle is then covered with powdered resin, or anointed with turpentine; and lest there should be a deficiency of tin, a small portion of rolled tin is likewise melted on it. The buckle is now taken off with tongs, and commonly laid on a bed of sand; where the plate and the ring, while the solder is yet in a state of fusion, are more closely compressed by a smart stroke with a block of wood. The buckle is afterwards bent and finished.

The usual mode of plating is, to fasten plates of silver upon thicker plates of copper, and then to roll them together into thin plates. The copper is twelve times thicker than the silver, and one ounce of silver is rolled to a surface of three feet or more. The plates being thus made, they are then stamped by a single stroke into the size and form of buckles, buttons, spoons, &c.

It was a considerable period after the first invention of plating, before any other mode of manufacture, beside that we have been describing, was introduced; all the different articles, whether open, or solid, being made of plates stamped, or unstamped, pierced like open work, or plain and uniform on their surfaces. Time and improvement have, however, introduced a new variety of plated work, quite different in its texture, and which is applied to articles of ornament made with *open work*. This is plated wire; the making of which is an entirely distinct branch of the business.

The pieces of metal, to be plated for the purpose of making wire, are forged out of bar copper unalloyed. The true cylindrical shape is given to the copper by wire-drawing. The silver is then laid upon it much thinner in proportion to the copper than in the sheet-metal. The silver is first formed into a tube, one edge projecting a little over the other. A copper cylinder, a little less in diameter than the tube, and so much longer as to admit one end of it being fastened into a hole, is then heated red-hot, and fastened by one end in the hole; the tube is then slipped upon it, with the seam upwards. A

flat steel burnisher, with rounded polished edges, and a handle at each end, is now rubbed briskly backward, and forward, upon the over-lapped edges of silver, at the same time using considerable pressure. By these means, the two surfaces are completely welded together, and the place of union scarcely discoverable. The cylinder of copper, intended to be plated, is now made perfectly clean, the inside of the silver tube being the same. It is then put upon the cylinder, which is about two inches longer than the tube; a small groove is made round the cylinder, coinciding with the ends of the silver tube; into this groove the ends of the tube are closely worked, so as to render the space between the tube and the cylinder perfectly air-tight. When the cylinder and tube are together heated slightly red-hot, the same burnisher that was used to unite the tube, is now rubbed briskly over it in a longitudinal direction. This unites the silver firmly to the copper, and renders it fit for drawing into wire of various forms and sizes.

The common machinery for drawing brass and copper wire is then used. The great variety of figure and form given to it depends upon the plate through which it is drawn. Some is flat, some half round, some fluted. It is used for making bread-baskets, toast-racks, snuffers, and other light articles of elegant workmanship. This wire, after drawing, like sheets after rolling, is annealed, and cleaned with hot, diluted, sulphuric acid.

The last improvement, in plated manufacture, is the introduction of silver edges, beads, and mouldings.

PLATING is likewise applied to the mode of covering felt hats with a coat or surface of beaver, which gives the article nearly the appearance of a fine castor hat, but not its durability. See HATS.

PLATTING, the slips of cane, straw, or chip for making hats, woven, or platted into pieces.

PLEDGE. See PAWN.

PLIERS, an instrument like a pair of pincers, by which any thing is laid hold on to bend it.

PLOUGH, in agriculture, a well-known machine for the breaking up of ground, that consists of a train, and two large irons, namely, the coulter and the share; the one pointed, the other edged.

The iron parts of ploughs are manufactured principally at Sheffield, Birmingham, Wolverhampton, Dudley, &c.; the wooden frames are made in almost every considerable town and village throughout Great Britain.

PLUMS, or DRIED PLUMS, (GER. *Getrocknete pflaumen* oder *zwetschen*. DU. *Drooge pruimen*. DA. *Törre blommer*. SW. *Torra plommon*, *Sviskon*. FR. *Pruneaux*, *Prunes seches*. IT. *Prugne d'usine sechee*.

SP. *Ciruelas pasas*. PORT. *Passa de ameixas*. RUS. *Tschernostliw*. POL. *Sliwki suche*.) more usually are the fruit of the plum-tree, dried in the sunshine, or in an oven. The best kind of plums known in commerce are the large black ones brought from Bourdeaux. There are other parts of France which produce excellent plums, whence the Dutch procure large quantities, and extract from them a liquor, which they make use of at sea, esteeming it a fine antiscorbutic. These are of a smaller kind, and are what we know by the distinction of *prunes*.

Germany is also noted for the excellence and abundance of its *prunes*. In Bamberg, the capital of the bishopric of the same name, *prunes*, by no means inferior to those of France, are frequently to be met with; these are the produce of the surrounding country, and are sent in large quantities to Holland.

The county of Hanau is also fertile in plums, which are dried and sent to Frankfurt on the Maine, whence they are exported to England, Holland, &c.

At Amsterdam are found both sorts of dried plums. These are sold by the quintal of 100lb. with an allowance of 18 per cent. for tare; of 2 per cent. for fair or good weight, and of 1 per cent. for prompt payment.

Prunes are mostly employed for culinary purposes; and the larger sort of French plums as a sweet-meat.

PLUMBAGO, or black lead, is a well-known substance, of a black colour, and shining appearance when cut. Its texture is rather scaly, but its fracture exhibits a granular and dull appearance. None of the specimens have any considerable hardness. See title BLACK LEAD; also, ANTI-ATTRITION.

PLUMBERY, the art of casting, and working, lead, and using it in buildings.

As this metal melts very readily, it is easy to cast it into figures of any kind, by running it into moulds of brass, clay, plaster, &c. But the chief article in plumbery is sheets and pipes of lead; and as these make the basis of the plumber's work, we shall here give the process of making them.

In casting sheet-lead, a table or mould is made use of, which consists of large pieces of wood well jointed, and bound with bars of iron at the ends; on the sides of which runs a frame, consisting of a ledge, or border of wood, two or three inches thick, and two or three inches high from the mould, called the sharps; the ordinary width of the mould, within these sharps, is from three, to four, feet, and its length is sixteen, seventeen, or eighteen feet. This should be something longer than the sheets are intended to be, in order that the end, where the metal runs off from the mould, may be cut off; because it is commonly thin, or uneven, or ragged at the end. It must stand very even or level in breadth, and something falling from the

end in which the metal is poured in, viz, about an inch, or an inch and a half, in the length of sixteen, or seventeen, inches. At the upper end of the mould stands the pan, which is a concave triangular prism, composed of two planks nailed together at right angles, and two triangular pieces fitted in between them at the ends. The length of this pan is the whole breadth of the mould, in which the sheets are cast; it stands with its bottom, which is a sharp edge, on a form at the end of the mould, leaning with one side against it; and on the opposite side is a handle to lift it up by, to pour out the melted lead; and on that side of the pan next the mould, are two iron hooks to take hold of the mould, and prevent the pan from slipping, while the melted lead is pouring out of it into the mould. This pan is lined on the inside with moistened sand, to prevent it from being fired by the hot metal. The mould is also spread over, about two-thirds of an inch thick, with sand sifted and moistened, which is rendered perfectly level by moving over it a piece of wood called a strike, by trampling upon it with the feet, and smoothing it over with a smoothing-plane; which is a thick plate of polished brass, about nine inches square, turned up on all the four edges, and with a handle fitted on to the upper, or concave, side. The sand being thus smoothed, it is fit for casting sheets of lead; but if they would cast a cistern, they measure out the size of the four sides, and having taken the dimensions of the front or fore-part, make mouldings, by pressing long slips of wood, which contain the same mouldings into the level sand, and form the figures of birds, beasts, &c. by pressing in the same manner leaden figures upon it, and then taking them off, and at the same time smoothing the surface where any of the sand is raised up by making these impressions upon it. The rest of the operation is the same in casting either cisterns or plain sheets of lead. But before we proceed to mention the manner in which that is performed, it will be necessary to give a more particular description of the strike.

The strike then is a piece of board about five inches broad, and something longer than the breadth of the mould on the inside; and at each end is cut a notch, about two inches deep, so that when it is used, it rides upon the sharps with those notches. Before they begin to cast, the strike is made ready by tacking two pieces of an old hat on the notches, or by slipping a case of leather over each end, in order to raise the under side about one-eighth of an inch, or something above the sand, according as they would have the sheet to be in thickness; then they tallow the under edge of the strike, and lay it across the mould. The lead being melted, it is laded into the pan, in which, when there is a sufficient quantity for the present purpose, the scum of the metal is swept off

with a piece of board to the edge of the pan, letting it settle on the sand, which is by these means prevented from falling into the mould, at the pouring out of the metal. When the lead is cool enough, which is known by its beginning to stand with a shell or wall on the sand round the pan, two men take the pan by the handle, or one of them lifts it up by a bar and chain, fixed to a beam in the ceiling, and pour it into the mould, while another man stands ready with the strike, and, as soon as they have done pouring in the metal, puts on the mould, sweeps the lead forward, and draws the overplus into a trough prepared to receive it. The sheets being thus cast, nothing remains but to planish the edges, in order to render them more smooth and straight; but if it be a cistern, it is bent into four sides, so that the two ends may join the back, where they are soldered together, after which the bottom is soldered up.

The method of casting pipes without soldering.—To make these pipes they have a kind of little mill, with arms or levers to turn it with. The moulds are of brass, and consist of two pieces, which open, and shut, by means of hooks and hinges, their inward caliber or diameter being according to the size of the pipe to be made, and their length is usually two feet and a half. In the middle is placed a core, or round piece, of brass or iron, somewhat longer than the mould, and of the thickness of the inward diameter of the pipe. This core is passed through two copper-rundles, one at each end of the mould, which they serve to close; and to these is joined a little copper tube about two inches long, and of the thickness the leaden pipe is intended to be of. By means of these tubes the core is retained in the middle of the cavity of the mould. The core being in the mould, with the rundles at its two ends, and the lead melted in the furnace, they take it up in a ladle, and pour it into the mould, by a little aperture at one end, made in the form of a funnel. When the mould is full, they pass a hook into the end of the core, and turning the mill, draw it out; and then opening the mould, take out the pipe. If they desire to have the pipe lengthened, they put one end of it in the lower end of the mould, and pass the end of the core into it; then shut the mould again, and apply its rundle and tube as before, the pipe just cast serving for rundle, &c. at the other end. Things being thus replaced, they pour in fresh metal, and repeat the operation till they have got a pipe of the length required.

For making pipes of sheet-lead, the plumbers have wooden cylinders of the length and thickness required, and on these they form their pipes by wrapping the sheet around them, and soldering up the edges all along them.

The other articles made by the plumber,

besides those already mentioned, are chiefly coffins, cisterns, pumps, the apparatus for water-closets, &c.

PLUME-ALUM, (GER. *Federalalun*. Du. *Pluimaluin*. DA. *Fieeralun*. Sw. *Fjederalun*. Fr. *Alun de plume*. It. *Allume de piuma*. Sp. *Alumbre de pluma*. Port. *Pedra hume de penna*. LAT. *Alumen plumosum*), is a name given to two very different substances. The one appears to be true alum, produced by the desiccation of a luminous water, which transudes through grottoes and caverns, and leaves this salt behind in feathery crystals. This is seldom met with.

The other substance, to which this name is given, is the fibrous asbestos, which contains no alum; but from half to three-fourths of its weight of silex, from one-eighth to one-third of carbonat of magnesia, and the rest lime, with a minute proportion of clay, and sometimes iron.

PLUMMET, plumb-rule, or plumb-line, an instrument used by carpenters, masons, &c. in order to judge whether walls, &c. are upright planes, horizontal, or the like. It is thus called from a piece of lead, *plumbum*, fastened to the end of a cord, which usually constitutes this instrument. Sometimes the string descends along a wooden ruler, &c. raised perpendicularly on another, in which case it becomes a level.

PLUMMING, among miners, is the method of using a mine-dial, in order to know the exact place of the work where to sink down an air-shaft, or to bring an adit to the work, or to know which way the load inclines when any flexure happens in it.

A skilful person, with an assistant, and with pen, ink, and paper, a long line and a sun-dial, after his guess of the place above ground, descends into the adit or work, and there fastens one end of the line to some fixed thing in it; then the incited needle is let to rest, and the exact point where it rests is marked with a pen; he then goes on farther in the line still fastened, and at the next flexure on the adit he makes a mark on the line by a knot or otherwise; and then letting down the dial again, he there likewise notes down that point, at which the needle stands, in this second position. In this manner he proceeds, from turning to turning, marking down the points, and marking the line, till he comes to the intended place; this done, he ascends and begins to work on the surface of the earth what he did in the adit, bringing the first knot in the line to such a place where the mark of the place of the needle will again answer its pointing, and continues this till he comes to the desired place above ground, which is certain to be perpendicularly over the part of the mine into which the air-shaft is to be sunk.

PLUMULE, by some denominated

Acrospire, signifies generally, in botany, the stem or stalk of a plant when it first begins to burst from the seed, and to grow. It claims notice here only, as applied to the operation of making malt. It is that inchoate artificial vegetation which is produced by steeping barley, in the process of malting it. See title MALT.

PLUSH, a kind of stuff having a sort of velvet nap, or shag, on one side, composed regularly of a single woollen thread, and a double warp; the one wool, or two threads twisted, the other goats' or camels' hair; though there are some plushes entirely of worsted, and others composed wholly of hair.

Plush is manufactured, like velvet, on a loom with three treadles; two of these separate and depress the woollen warp, and the third raises the hair warp, upon which the workman throwing the shuttle, passes the woof between the woollen, and hair, warp; and afterwards laying a brazen broach, or needle, under that of the hair, he cuts it with a knife destined for that use, conducting the knife on the broach, which is made a little hollow all its length, and thus gives the surface of the plush an appearance of velvet.

There are other kinds of plush, all of silk: some of which have a pretty long nap on one side, and some on the other. Some kinds of plush are likewise entirely made of worsted; these are, however, generally called shag. Cotton has also been recently introduced into manufactures of the plush kind.

POCKET, in the wool trade, a word used to denote a larger sort of bag, in which wool is packed up to be sent from one part of the kingdom to another. The pocket usually contains twenty-five hundred-weight of wool.

The pocket of hops is a small bag usually containing the best hops.

POCKET-BOOKS, (GER. *Briefaschen*. Du. *Brieflassen*. DA. *Breftasker*. Sw. *Brefvaskor*. Fr. *Porte-feuilles*. It. *Cartelle*. Sp. *Carteras*. Port. *Carteiras*), are small cases usually so compactly formed, that they may be carried in the pocket; whence their designation. Pocket-books are sometimes, however, equal in size to the port-folios of painters, &c.; being intended for the use of commercial travellers, and others who have occasion to carry about with them patterns of small volume, or considerable value. Pocket-books are usually made of Morocco leather of various colours, ornamented occasionally with silver or plated mountings, locks and clasps; but some are perfectly plain, and secured only by means of a strap. The best pocket-books are made at London, where they are finished in the most elegant style, and whence there is a considerable trade in the article to different parts of the world. At Birmingham there are several

persons engaged in this branch of trade, who derive considerable emolument from sending assorted parcels of pocket-books to the continent of Europe; where they have scarcely ever failed to meet a ready sale.

Fancy pocket-books made of silk, and embroidered, &c. are seldom exported from England; but in France, Spain, and Portugal, most of the religious recluses are engaged in making them, and baubles of a similar kind.

POINT, an iron or steel instrument, used with some variety in several arts. Engravers, etchers, cutters in wood, &c. use points to trace their designs on the various substances upon which they work. See ENGRAVING, &c.

POINT, in manufactures, is a general term used for all kinds of laces wrought with the needle; such are the *point de Venice*, the *point de France*, *point de Genoa*, &c. which are distinguished by the particular economy and arrangement of their points.

POINTING, in the sea language, as applied to the cable, is untwisting it at the end, lessening the yarn, twisting it again, and making all fast with a piece of marline, to keep it from ravelling out.

POISON-NUTS. (GER. *Krähenaugen*. DU. *Braaknooten*, *Kraanöoger*. DA. *Krantsjine*, *Bræknüdder*. SW. *Räfkaka*. FR. *Noix vomiques*. IT. *Noci vomiche*. SP. *Mataperros*, *Matacan*, *Nuez vomica*. PORT. *Noz vomica*, *Canirão*. RUS. *Zälibuchui*. POL. *Wronie oko*. LAT. *Nuces vomicae*.) See NUX VOMICA.

POLCHEN, a German copper coin, equivalent to 7-30ths of a penny, sterling.

POLE, or *vertex of a glass*, is the thickest part of a convex, or the thinnest of a concave glass. If the glass be truly ground, the pole will be exactly in the middle of its surface.

POLE, PERCH, or ROD, is a land-measure, containing sixteen feet and a half. Five and a half yards make a pole; forty poles in length, make a furlong; and forty square poles make a rood. It is here necessary to observe, that the pole is different in different counties; in Lancashire, seven yards make a pole; in Cheshire, an adjoining county, they reckon eight yards to the pole; and in some counties six yards go to a pole.

POLICY OF ASSURANCE, the deed or instrument by which a contract of assurance is effected.

A policy of insurance is, therefore, a contract between A. and B., that upon A.'s paying a premium equivalent to the hazard run, B. will indemnify, or insure, him against a particular event. This is founded upon one of the same principles, as the doctrine of interest upon loans, that of hazard; but not that of inconvenience. For if I insure a ship to the Levant, and back again, at five per cent., here I calculate the chance that she

performs her voyage to be twenty to one against her being lost: and, if she be lost, I lose 100*l.* and get 5*l.* Now this is much the same as if I lend the merchant whose whole fortunes are embarked in this vessel, 100*l.* at the rate of eight per cent. For by a loan I should be immediately out of possession of my money, the inconvenience of which we have supposed equal to three per cent.: if therefore I had actually lent him 100*l.*, I must have added 3*l.* on the score of inconvenience, to the 5*l.* allowed for the hazard, which together would have made 8*l.* But, as upon an insurance, I am never out of possession of my money till the loss actually happens, nothing is therein allowed upon the principle of inconvenience, but all upon the principle of hazard. Thus, too, in a loan, if the chance of repayment depend upon the borrower's life, it is frequent (besides the usual rate of interest) for the borrower to have his life insured till the time of repayment; for which he is loaded with an additional premium, suited to his age, and constitution. Thus, if Sempronius has only an annuity for his life, and would borrow 100*l.* of Titius for a year; the inconvenience, and general hazard, of this loan, we have seen, are equivalent to 5*l.* which is therefore the legal interest: but there is also a special hazard in this case; for if Sempronius die within the year, Titius must lose the whole of his 100*l.* Suppose this chance to be, as one to ten: it will follow, that the extraordinary hazard is worth 10*l.* more, and therefore, that the reasonable rate of interest in this case would be fifteen per cent. But this the law, to avoid abuses, will not permit to be taken; Sempronius therefore gives Titius the lender only 5*l.* the legal interest; but applies to Gaius an insurer, and gives him the other 10*l.* to indemnify Titius against the extraordinary hazard. And in this manner, may any extraordinary, or particular, hazard be provided against, which the established rate of interest will not reach; that being calculated by the state to answer only the ordinary and general hazard, together with the lender's inconvenience in parting with his specie for the time. 2 Black. 459.

Insurance is, however, in effect nothing more than a wager, for the underwriter, who insures at five per cent. receives five pounds, to return one hundred upon the contingency of a certain event; and it is precisely the same in its consequences, as if he had betted a wager of 95*l.* to five, or nineteen to one, that the ship arrives safe, or that a certain event does not happen. So where a life is insured for a year at ten per cent., that is, where ten pounds are received to pay one hundred, if a certain person die within a year; this insurance is in effect precisely the same, as a wager of nine to one, that the person, whose life is insured, lives a year. It is not surprising, then, that insurance should

have become so prevalent, and pernicious, a mode of gaming, that the legislature was obliged to repress it, and to confine it within those limits, within which it is beneficial, or absolutely necessary, to the security of commerce. The writers on mercantile law, with that natural partiality which authors feel for their subjects, have amused themselves by endeavouring to discover what country could first claim the honour of the invention of insurance. But it is a contract far too simple, and too obvious to the understandings of mankind, however uncultivated, to be dignified by the name of invention. Yet its progress and refinements would be a necessary consequence of the extension of commerce, and the gradual improvement in the science of law. *Ibid. N. by Chris.*

The premium or consideration paid for the risk or hazard assured against, must be inserted in the policy, and likewise the day, month, and year, on which the policy is executed, and it must be duly stamped.

Policies for assurance against the risks of sea are distinguished into valued, and open, policies; in the former, the goods or property assured are valued at prime cost, at the time of effecting the policy of insurance; in the latter the value is not mentioned, but is left to be afterwards declared, or to be proved in the event of a claim. In a valued policy, the proper effect of the valuation is the affecting the amount of the prime cost, in the same manner, as if the parties had admitted it at trial; but for every other purpose it must be taken, that the value was fixed in such a manner, as that the insured meant to have an indemnity, and no more. The practice of permitting the insured on a valued policy to recover the whole sum insured upon a total loss, though his interest is less than that sum, is against the statute. A valued policy on profits expected upon a voyage is not within the act, the object of insurance being an indemnity. When a policy is once executed, it cannot be altered by either party; as this would open the door to an infinite variety of frauds, and introduce uncertainty into a species of contract, of which certainty and precision are the most essential requisites. If, however, a policy be filled up by mistake different from the original agreement, it may, even after signing, be corrected by the consent of both parties. An underwriter may, however, shift the insurance, or any part of it, from himself to other insurers, by causing a re-insurance to be made on the same risk, and the new insurers will be responsible to him, in case of loss, to the amount of the re-insurance; but the re-insurer is only responsible to the original insurer, and not to the original insured.

The form of the policies in common use among the underwriters of London, for sea assurances, is nearly the same that was adopted two hundred years ago; but, as Mr. Park justly observes, its antiquity can-

not free it from just censure, on account of its irregularity and confusedness, as well as its frequent ambiguity, occasioned by the same words being used in different senses. The policies, generally used for assurances on lives, or against fire, are infinitely more correct and intelligible.

For decided cases relative to policies, *see* INSURANCE.

FORMS OF POLICIES.

Form of a Policy of Assurance upon a Ship and Furniture, pursuant to Statute.

£500.

S.
delivered the
day of

In the name of God,
Amen.
as well in own
name, as for and in the

name and names of all and every other person to whom the same doth, may, or shall, appertain, in part or in all, doth make assurance, and cause and them, and every of them, to be assured, lost or not lost, at and from upon the body, tackle, apparel, ordnance, munition, artillery, boat, or other furniture, of and in the good ship or vessel called the whereof is master, under God, for this present voyage, or whomsoever else shall go for master in the said ship, or by whatsoever other name or names the same ship, or the master thereof, is or shall be named or called: beginning the adventure upon the said ship, &c. from and immediately following and so shall continue and endure until the said ship, with her said tackle, apparel, &c. shall be arrived at and there hath moored at anchor twenty-four hours in good safety; and it shall be lawful for the said ship in this voyage to proceed and sail to and touch and stay at any ports or places whatsoever without prejudice to this assurance; the said ship, &c. for so much as concerns the assured, is, and shall be valued at.

Touching the adventures and perils at which we the assurers are content to bear and to take upon us in this voyage, they are, of the seas, men of war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master and mariners, and all other perils, losses, or misfortunes, that have or shall come to the hurt, detriment, or damage of the said ship, &c. or any part thereof: and in case of any loss or misfortune, it shall be lawful to the assured, their factors, servants, and assigns, to sue, labour, and travel, for, in, and about, the defence, safeguard, and recovery, of the said ship, &c., or any part thereof, without prejudice to this assurance, to the charges whereof we the assurers will contribute each one according to the rate and quantity of his sum

herein assured: and it is farther agreed by us, the assurers, that this writing or policy of assurance shall be of as much force and effect as the surest writing or policy of assurance heretofore made in Lombard-street, or in the Royal Exchange, or elsewhere in London: and so we the assurers are contented, and do hereby promise and bind ourselves, each one for his own part, our heirs, executors, and goods, to the assured, their executors, administrators, and assigns, for the true performance of the premises, confessing ourselves paid the consideration due unto us for this assurance by the assured of _____ at and after the rate of _____

In witness whereof we the assured have subscribed our names and sums assured in London.

N.B. The ship and freight warranted free from average under three pounds per cent. unless general, or the ship be stranded.

Policy of Assurance upon Goods, ditto.

rived at upon the said ship, &c. until she hath moored at anchor twenty-four hours in good safety, and upon the goods and merchandise until the same shall be there discharged and safely landed; and it shall be lawful for the said ship, &c. in this voyage, to proceed and sail to and touch and stay at any ports or places whatsoever, without prejudice to this assurance; the said ship, &c. goods and merchandise, &c. for so much as concerns the assured, by agreement between the assured and assurers, in this policy, are and shall be valued at

Touching the adventures and perils which we the assurers are content to bear, and to take upon us in this voyage, they are, of the seas, men of war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detentions of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master or mariners, and of all other perils, losses, and misfortunes, that have or shall come to the hurt, detriment, or damage of the said goods and merchandise, and ship, &c. or any part thereof; and in case of any loss or misfortune, it shall be lawful to the assured, their factors, servants, and assigns, to sue, labour, and travel, for, in, and about the defence, safeguard, and recovery of the said goods and merchandise, and ship, &c. or any part thereof, without prejudice to this assurance, to the charges whereof we the assurers will contribute each one according to the rate and quantity of his sum herein assured; and it is agreed by us the assurers that this writing or policy of assurance shall be of as much force and effect as the surest writing or policy of assurance heretofore made in Lombard-street, or in the Royal Exchange, or elsewhere in London; and so we the assurers are contented, and do hereby promise and bind ourselves, each one for his own part, our heirs, executors, and goods, to the assured, their executors, administrators, and assigns, for the true performance of the premises, confessing ourselves paid the consideration due unto us for this assurance by the assured at and after the rate of

In witness whereof we the assurers have subscribed our names and sums assured in London.

N.B. Corn, fish, salt, fruit, flour, and seeds, are warranted free from average, unless general, or the ship be stranded; sugar, tobacco, hemp, flax, hides, and skins, are warranted free from average under five pounds per cent.; and all other goods, also the ship and freight, are warranted free from average, under three pounds per cent. unless general, or the ship be stranded.

It has been decided that rice was not corn within the meaning of a memorandum on a policy. *Scott v. Bourdillon*, 2 N. R. 213.

The memorandum controuls the general words of a policy, so far as it extends; but upon a stranding, the enumerated articles are in the same situation as other commodities, and the insurers become liable for all damage, though not arising from the stranding. *Brownrig v. Elmsley*, 7 T. R. 216.

Policy on fruit from Cadiz to London, with usual memorandum. During voyage fruit was so much damaged by sea-water, that it became rotten and stunk. On ship arriving at an intermediate port, she was prohibited from landing: Ship was too much damaged to proceed, and was sold, and the cargo necessarily thrown overboard. Held that the assured were entitled to recover for a total loss.

as well in own name as for and in the name and names of all and every other person or persons to whom the same doth, may, or shall, appertain, in part or in all, doth make assurance, and causeth

and them, and every of them to be assured, lost or not lost, upon any kind of goods or merchandise whatsoever, loaden or to be loaden, and also upon the body, tackle, apparel, ordnance, munition, artillery, boat, and other furniture, of and in the good ship or vessel called the burthen or thereabouts, whereof is master, under God, for this present voyage

or whosoever else shall go for master in the said ship, or by whatsoever other name or names the same ship or the master thereof is or shall be named or called: beginning the adventure upon the said goods and merchandise from and immediately following the loading thereof on board the said ship and upon the said ship, &c.

and so shall continue and endure during her abode there upon the said ship, &c. and farther, until the said ship, with all her ordnance, tackle, apparel, &c. and goods and merchandise whatsoever, shall be arrived at upon the said ship, &c. until she hath there moored at anchor twenty-four hours in good safety, and upon the goods and merchandise, until the same be there discharged and safely landed; and it shall be lawful for the said ship, &c. in this voyage to proceed and sail to, and touch and stay at any ports or places whatsoever, without prejudice to this assurance, for the said ship, &c. goods and merchandise, &c. for so much as concerns the assured, (by agreement made between the assured and the corporation in this policy,) are and shall be rated and valued at sterling,

without farther account to be given by the assured for the same. Touching the adventure and perils which the said corporation are contented to bear and do take upon them in this voyage, they are, of the seas, men of war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master and mariners, and of all other perils, losses, and misfortunes that have or shall come to the hurt, detriment, or damage of the said goods and merchandise, and ship, &c. or any part thereof: and in case of any loss or misfortune, it shall be lawful to the assured, their factors, servants, and assigns, to sue, labour, and travel for, in, and about the defence, safeguard, and recovery, of the said goods, and merchandise, and ship, &c. or any part thereof, without prejudice to this assurance, to the charges whereof the said corporation will contribute according to the rate and quantity of the sum herein assured: and it is agreed by the said corporation, that this

writing or policy of assurance shall be of as much force and effect as the surest writing or policy of assurance heretofore made in Lombard-street, or in the Royal Exchange, or elsewhere in London, and so the said corporation are contented, and do hereby promise and bind themselves and their successors to the assured, their successors, administrators, and assigns, for the true performance of the premises, confessing themselves paid the consideration due unto them for this assurance by at and after the rate of per cent. In witness whereof the said corporation have caused their common seal to be hereunto affixed and the sum or sums by them assured, to be hereunder written, at their office in the Royal Exchange of London, this day of in the year of the reign of our sovereign lord by the grace of God, of Great Britain, France, and Ireland, king, defender of the faith, &c. and in the year of our Lord

The said corporation are content with this assurance for

Free from all average on corn, flour, fish, salt, fruit, seeds, hides, and tobacco, unless generally or otherwise specially agreed.

Free from average of sugar, rum, skins, hemp, and flax under 5 per cent., and on all other goods, and on stuff under 3 per cent., except the said governor and company, &c.

The Stamp Duties on Policies of Assurance.

Policy of assurance upon any life or lives, or upon any event depending upon life or lives,

Where the sum insured shall not amount to 500*l*. - - 1 0 0

Amounting to 500*l*. and not to 1000*l*. 2 0 0

Amounting to 1000*l*. and not to 3000*l*. 3 0 0

Amounting to 3000*l*. and not to 5000*l*. 4 0 0

And amounting to 5000*l* or upwards 5 0 0

Policy of assurance from the loss of damage by fire only - 0 1 0

And for every 100*l*. and so in proportion for any greater or less sum, which shall be insured by any such policy, a duty at the rate of 5*s*. per cent. per annum.

Policy of assurance of or upon buildings, goods, wares, merchandises, or other property, in the West Indies, or elsewhere beyond the seas, from loss or damage by fire, for not exceeding twelve calendar months 0 2 6

And also the additional duty following, viz.

If the whole sum insured shall not exceed 100*l*. - 0 5 0

And if the whole sum insured shall exceed 100*l*., then for every 100*l*., and also for any

fractional part of 100*l*., whereof the same shall consist - 0 5 0

Policy of assurance upon any ship or vessel, or upon any goods, merchandises, or other property, on board of any ship, or vessel, or upon the freight, or upon any other interest in or relating to any ship or vessel, which may lawfully be insured, for any voyage from any port in the united kingdom, to any other port in the said kingdom;

Where the premium shall not exceed 20*s*. per cent. on the sum insured,

If the whole sum insured shall not exceed 100*l*. - 0 1 3

And if the whole sum exceed 100*l*., then for every 100*l*., and also for any fractional part of 100*l*., whereof the same shall consist - 0 1 3

And where the premium shall exceed 20*s*. per cent.

If the whole sum insured shall not exceed 100*l*. - 0 2 6

And if the whole sum exceed 100*l*., then for every 100*l*. and also for any fractional part of 100*l*. - 0 2 6

But if the separate interests of two or more distinct persons shall be insured by one policy, then the said duty shall be charged, in respect of each fractional part of 100*l*., as well as in respect of every full sum of 100*l*., which shall be thereby insured upon any separate interest.

Policy of assurance upon any ship or vessel, or upon any goods or other property on board, or upon the freight, or any other interest which may lawfully be insured, for or upon any other voyage than before specified, or for any certain period of time, not exceeding twelve calendar months;

Where the premium shall not exceed 20*s*. per cent. on the sum insured,

If the whole shall not exceed 100*l*. 0 2 6

And if the whole sum insured shall exceed 100*l*., then for every 100*l*., and also for any fractional part of 100*l*., whereof the same shall consist - 0 2 6

And where the premium shall exceed 20*s*. per cent.,

If the whole sum insured shall not exceed 100*l*. - 0 5 0

And if the whole sum insured shall exceed 100*l*., then for every 100*l*., and also for any fractional part of 100*l*., whereof the same shall consist, - 0 5 0

But if the separate interests of two or more persons be insured by one policy, then the said duty of 2*s*. 6*d*. or 5*s*. shall be charged in respect of each fractional part of 100*l*., as well as in respect of every 100*l*. which shall be thereby insured upon any separate interest.

Policy of assurance, commonly called mutual insurance, without premium, from any loss, damage, or misfortune to any ship or vessel, or any goods on board, or the

freight, or any other interest which may lawfully be insured;

Upon any voyage from any port in the united kingdom, or in the islands of Guernsey, Jersey, Alderney, or Sark, or Man, to any other port therein,

For every 100%, and also for each fractional part of 100%, thereby insured to any person - - - - - 0 2 6

Upon any other voyage whatsoever, or for any other certain term, not exceeding twelve calendar months.

For every sum of 100%, and also for each fractional part thereby insured to any person - - - - - 0 5 0

Policy of assurance, whereby any other lawful insurance whatever, not hereinbefore charged, shall be made upon any property or interest whatever, from loss or damage of any kind,

Where the premium shall not exceed 20s. per cent.

If the whole sum insured shall not exceed 100% - - - - - 0 2 6

If the whole sum shall exceed 100%, then for every 100% and also for any fractional part of 100%, whereof the said sum shall consist - - - - - 0 2 6

And where the premium shall exceed 20s. per cent. on the sum insured, and also where the insurance shall be made for any other than a pecuniary consideration,

If the whole sum insured shall not exceed 100% - - - - - 0 5 0

And if the whole exceed 100%, then for every 100%, and also for every fractional part of 100% - - - - - 0 5 0

But if the separate interests of two, or more, shall be insured by one policy, then the said duty of 2s. 6d., or 5s., shall be charged in respect of each fractional part of 100%, as well as in respect of every full 100% which shall be thereby insured on any separate interest.

A policy of insurance, as has been observed before, under title insurance, when effected, becomes the property of the insured; and if it be wrongfully withheld, either by the broker employed to effect it, or by any other person into whose hands it may come, he may maintain an action of trover for it, the same as for any other property.

POLISHER, or **BURNISHER**, among mechanics, an instrument for polishing and burnishing things proper to take a polish.

The gilders use an iron polisher to prepare their metals before gilding, and the blood-stone to give them the bright polish after gilding.

The polisher used by the makers of spurs, bits, &c. is partly iron, partly steel, and partly wood; it consists of an iron bar, with a wooden handle at one end, and a hook at the other, to fasten it to a second piece of wood held in the vice, while the operator is at work. In the middle of the bow within-side, is that properly called the

polisher, being a triangular piece of steel, with a tail, whereby it is rivetted to the bow.

The polishers among cutlers are a kind of wooden wheels made of walnut-tree, about an inch thick, and of a suitable diameter. These are turned round by the great wheel, and with the addition of emery and putty, serve to polish the work.

The polishers for glass consist of two pieces of wood; the one flat, covered with old hat; the other long and half round, fastened on the former, whose edge it exceeds on both sides by some inches, which serve the workmen to take hold of, and to work backwards and forwards by.

The polishers used by spectacle-makers are pieces of wood a foot long, seven or eight inches broad, and an inch and a half thick, covered with old beaver-hat, on which they polish the shell and horn frames, in which their spectacle-glasses are to be set.

POLISHING is the operation of giving a gloss or lustre to certain substances susceptible of such embellishment, as precious stones, marble, glass, &c.

Mode of Polishing and Grinding Glass.

In order to grind plate-glass, they lay it horizontally upon a flat stone table, made of a very fine-grained freestone; and for its greater security, they plaister it down with mortar or stucco. The stone table is supported by a strong wooden frame, with a ledge all round its edges, rising about two inches above the glass. Upon the plate to be ground is laid another rough glass, not above half as big, and so loose, as to slide upon the former; but cemented to a wooden plank, to guard it from the injury it must otherwise receive from the scraping of the wheel whereto the plank is fastened, and from the weights laid upon it to promote the triture or grinding of the glasses. The whole is covered with a wheel made of hard, light wood, about six inches in diameter; by pulling of which backwards and forwards alternately, and sometimes turning it round, the workmen, who always stand opposite to each other, produce a constant attrition between the two glasses, and bring them to what degree of smoothness they please, by first pouring in water and coarse sand; after that, a finer sort of sand, as the work advances, till at last they pour in the powder of smalt. As the upper or incumbent glass becomes smooth, it must be removed, and another, from time to time, substituted for it.

The engine just described is called a mill by the workmen, and is employed only in grinding the largest-sized glasses. In grinding lesser glasses, they usually work without a wheel, having four wooden handles fastened to the corners of the stone that loads the upper plank, by which they work it about. The grinder's part done, the glass is turned

over to the polisher, who with fine powder of tripoli stone or emery, brings it to a perfect evenness and lustre. The instrument made use of in this branch, is a board furnished with a felt and small roller, which the workman moves by means of a double handle at both ends. The artist in working this roller, is assisted by a wooden hoop, or spring, to the end of which it is fixed; for the spring, by constantly bringing the roller back to the same points, facilitates the action of the workman's arm.

Manner of Polishing Optical Glasses.

The operation of polishing optic glasses, after being properly ground, is one of the most difficult points of the whole process. Before the polishing is begun, it is proper to stretch an even well-wrought piece of linen over the tool, dusting upon it some very fine tripoli. Then taking the glass in your hand, run it round forty or fifty times upon the tool, to take off the roughness of the glass about the border of it. This cloth is then to be removed, and the glass to be polished upon the naked tool, with a compound powder, made of four parts tripoli mixed with one of fine blue vitriol; six or eight grains of which mixture are sufficient for a glass five inches broad. This powder must be wetted with eight or ten drops of clear vinegar in the middle of the tool; being first mixed and softened thoroughly with a very fine small muller. Then with a nice brush having spread this mixture thinly and equably upon the tool, take some very fine tripoli, and strew it thinly, and equably, upon the tool so prepared; after which, take the glass to be polished, wiped very clean, and apply it on the tool, and move it gently twice or thrice in a straight line backwards and forwards; then take it off, and observe whether the marks of the tripoli, sticking to the glass, are equably spread over the whole surface; if not, it is a sign that either the tool or glass is too warm; in which case you must wait awhile and try again, till you find the glass takes the tripoli every where alike. Then you may begin to polish boldly, there being no danger of spoiling the figure of the glass, which in the other case would infallibly happen. This is Mr. Huygen's method; but it ought to be observed, that almost every operator has a peculiar one of his own.

Sir Isaac Newton no where expressly describes his method of polishing optical glasses; but his method of polishing reflecting metals he thus describes in his *Optics*. He had two round copper plates, each six inches in diameter, the one convex, the other concave, ground very true to one another. On the convex one he ground the object metal, or concave which was to be polished, till it had taken the figure of the

convex, and was ready for a polish. He then pitched over the convex very thinly, by dropping melted pitch upon it, and warming it to keep the pitch soft, whilst he ground it with the concave copper wetted, to make it spread evenly all over the convex, till it was no thicker than a groat-piece; and after the convex was cold he ground it again, to give it as true a figure as possible. He then ground it with very fine putty, till it made no noise; and then upon the pitch he ground the object-metal, with a brisk motion, for two or three minutes; when laying fresh putty upon the pitch, he ground it again till it had done making a noise, and afterwards ground the object-metal upon the pitch as before; and this operation he repeated, till the metal was perfectly polished.

POMATUM. (GER. *Pommade*. DU. *Pomaad*. DA. *Pomade*. SW. *Pomada*. FR. *Pommade*. IT. *Pomata*. SP. PORT. *Rus*. and POL. *Pomada*. LAT. *Pomatum*.) There are two descriptions, *soft*, and *hard*. The former is nothing more than hog's-lard well cleansed from impurities, by beating in rose-water; after which, a very small quantity of mutton suet is melted with it, and such perfume added, as will give it the odour designed; viz. jasmine, violet, bergamot, clove, &c. &c. Hard pomatum is made by melting mutton-suet, with as much hog's-lard as will destroy its excessive brittleness, and as much white-wax as will produce tenacity, with the addition of a little perfume. It is then melted, and poured into moulds, of the size required.

POMEGRANATE, Pomegranates, (GER. *Granatäpfel*. DU. *Granaatappelen*. DA. *Granatebla*. SW. *Granatäplen*. FR. *Granades*. IT. *Granati*, *Melagrani*, *Melagranti*. SP. *Granadas*. PORT. *Romãos*. RUSS. *Granatnoe jabloko*. POL. *Granatowe jablko*. LAT. *Granatorum mala*.) is a medicinal fruit, like an apple or quince, full of seeds, inclosed within a reddish pulp, containing either a sweet vinous juice, or one more acrid and acerb. Pomegranates grow in Spain, Portugal, Italy, France, and many other countries. The tree which yields them flowers in June, and the fruit is ripe in September. Of the kernels are made syrups and conserves; and the peel, which is called *maliciorium*, reckoned very astringent, is an ingredient in several remedies and pisans for dysenteries, diarrhæas, and relaxations of the gums. The ancients used the rind as moderns do sumach, in the preparation of leather. There is but little of the true conserve made; that which ordinarily passes for it, being only sugar melted down, to which they give the colour and sharp taste with cochineal, cream of tartar, and alum.

PONT, or PUNT, a long measure used in China, of which ten go to one cobre;

the cobre being about thirteen one-sixth French inches.

PONTAGE, duty paid for the reparation of bridges.

PONTYPOOL-WARE, a species of japanned ware, beautifully variegated with golden, and crimson, and black colours, principally manufactured at Pontypool, in Monmouthshire.

POOP, the stern of a ship, or the highest, uppermost, and hinder part of the ship's hull.

POPLAR. (GER. *Pappel*, *Pappelbaum*. DU. *Popelier*. DA. *Popel*. SW. *Poppeltrüd*. FR. *Peuplier*. IT. *Pioppo*. SP. *Alamo*. PORT. *Alamo*, *Alemo*. RUS. *Topol*. POL. *Topola*. LAT. *Populus*.) Of this genus, there are numerous species, the value of some of which are only now beginning to be known. Linnaeus reckons five, Miller seven, species; but even the larger estimate comes far short of the truth. For our purposes here, however, they may be best distinguished into two species, viz. the aspiring, and the horizontal; this being the great distinction between those which are applicable to mere ornament, and those which are essentially useful, and valuable as timber. The aspiring, or common Lombardy poplar, is of very inferior consideration, being brittle, and of no value as timber, unless it be of sufficient size to be sawn into boards, and even then, they are only fit for the commonest and coarsest purposes, being soft, subject to warping, and of an unseemly hue. Of the horizontal poplar, there are several sorts, but especially known by the descriptions of *black* and *white*. They will grow to an immense size, and make timber of great value for a variety of purposes, but are always best, and toughest, if not grown on a gravelly soil. A tree of the horizontal poplar has been known, in 20 years, to produce planks of 18 inches in breadth, which, after lying a month in the air, were so hard that none but the best tools would plane them, and that with difficulty, it being their distinguishing property to harden by exposure to the air. Boards of this species are excellent for the insides of ships, and other vessels, where fires are necessary to be kept, as they are actually fire proof, inasmuch as if a fire be lighted, even upon them, they are not ignitable. They have been lately applied to this purpose in several instances, with the utmost success.

Nor is this the only merit of the poplar, as a tree of use, independent of its ornament: for, from some experiments, it appears, that the poplar may be usefully employed in dyeing. The Italian, or Lombardy poplar, gives a dye of as fine a lustre, and equally durable, as that of the finest yellow wood, and its colour is more easily extracted. It is likewise very apt to unite with other colours in composition. Besides this, M. Dam-

bournay tried also the black poplar, the Virginian, the balsam, or liard, the white, and the trembling poplar; and found that all these dyed wool of a nut-colour, fawn-colour, nankin, musk, and other grave shades, according to the quantity of wood employed, and the length of time it was boiled.

POPPY, (GER. *Mohn*, *Magsamen*. DU. *Heulezaad*. DA. *Vallmue*. SW. *Valmo*, *Valmoge*. FR. *Pavot*. IT. *Papavero*. SP. *Adormidera*, *Dormidera*. PORT. *Dormideiran*. RUS. and POL. *Mak*. LAT. *Papaver*.) a well-known plant, of which there are nine species. The only one of these that deserves to be noticed in a commercial work, is the white officinal poppy. It grows often to the height of five or six feet, having large flowers, both single, and double, succeeded by capsules, or heads, as large as oranges, each containing about 8000 seeds.

We are told, that in the province of Bahar, in the East Indies, the poppy-seeds are sown in the months of October and November, at about eight inches distance, and well watered, till the plants are about half a foot high; when a compost of dung, nitrous earth, and ashes, is spread over the areas; and a little before the flowers appear, they are again watered profusely, till the capsules are half grown, at which time the opium is collected, for when fully ripe they yield but little juice: two longitudinal incisions from below upwards, without penetrating the cavity, are made at sun-set, for three or four successive evenings; in the morning, the juice is scraped off with an iron scoop, and worked in an iron pot in the sun's heat, till it is of a consistence to be formed into thick cakes, of about four pounds weight; these are covered over with the leaves of poppy, tobacco, or some other vegetable, to prevent their sticking together, and in this situation they are dried.

The wild poppy, which grows commonly in our corn fields, furnishes an extract which has been successfully employed as a sedative; a syrup of its flowers is useful as an anodyne and pectoral. See OPIUM.

PORCELAIN, a fine kind of earthenware, chiefly manufactured in China, and thence called China-ware. All earthenwares which are white and semi-transparent are generally called porcelain; but amongst these so great differences may be observed, that, notwithstanding the similarity of their external appearance, they cannot be considered as matters of the same kind.

The word porcelain is of European, probably of Portuguese, derivation; none of the syllables which compose it can even be pronounced or written by the Chinese, whose language comprehends no such sounds. It is called in China, tsé-ki.

The art of making porcelain, however, was brought from Japan, and China. The whiteness, transparency, fineness, neatness,

and even magnificence, of this pottery, which soon became the ornament of sumptuous tables, did not fail to excite the admiration and industry of Europeans; and their attempts have succeeded so well, that in different parts of Europe, earthenwares have been made so like the Oriental, that they have acquired the name of porcelain. The first were made in Saxony, and in France; and afterwards in England, Germany, and Italy; but as all these were different from the Japanese, so each of them had its peculiar character.

It would be to little purpose to give a description of the manufactories in China, on doubtful authority, and which no European ever visits; as little would it avail to attempt any explanation of an art, the *principles* of which are already almost universally known, and the *particular local* excellence of which cannot be carried into practice here, for want of the materials; we shall therefore proceed to notice the different species of China-ware, manufactured in Europe; many of which, especially in the department of painting, are nearly, if not perfectly, comparable with the productions of the mother country of the beautiful sort, at present under consideration.

Beside that of Saxony, which has been long established, porcelain is made at Vienna, at Frankenthal, and in the neighbourhood of Berlin. All these German porcelains are similar to the Saxon, and are made of materials of the same kind, although they differ somewhat from each other. England, and Italy, also have their porcelains.

But in no state of Europe have more effectual attempts been made to discover porcelain, or an earlier establishment of manufactures, than in France. The admirable works produced in the royal manufacture at Sévres do her most honour. This porcelain holds at present a distinguished rank, from its shining white, its beautiful glazing, and coloured grounds. The magnificence of the gilding, the regularity and elegance of its forms, surpass every thing of the kind. In the painting and sculpture much genius and talents are displayed. Lastly, as all the operations of this great establishment are directed by men of known capacity, assisted by philosophical and chemical researches, this manufacture produces porcelain capable of emulating or equalling the most perfect, and most solid, works of this kind.

We must carefully, however, distinguish the qualities which only contribute to beauty and external appearance, from the intrinsic and essential properties, in which the goodness, and solidity, of porcelain consist. All persons who have made experiments in this way have soon discovered the possibility of making compounds very white, beautifully semi-transparent, and covered with a shining glaze; but which cannot be worked for want

of tenacity, are not sufficiently compact, are essentially fusible, are subject to break by sudden application of heat and cold; and, lastly, the glazing of which cracks, becomes rough, and consequently loses its lustre by use, because it is too soft.

On the other side, we shall also find it not difficult to compose very tenacious pastes, which shall be capable of being easily worked and well-baked, which in the baking shall acquire the desirable hardness and density, which are infusible, and capable of sustaining very well the sudden change of heat and cold; and in a word, which shall have the qualities of the most excellent porcelain, excepting whiteness and beauty. The materials fit for the composition of such porcelains may be found abundantly in every country, and the only difficulty is to unite beauty and goodness in one composition.

Those potteries, called stone-ware, have all the essential qualities of the best Japanese, if we except whiteness, on which alone the semi-transparency depends. The same grain appears internally in both; the same sound is produced by striking them, when properly suspended; the same density, the same hardness, by which they strike fire with steel; the same faculty of sustaining the heat of boiling liquors without breaking, and the same infusibility in fire, are observable. Lastly, if the earth, of which stone-ware is made, were free from heterogeneous colouring matters, which prevent their whiteness and semi-transparency; if vessels were carefully formed; if all the proper attentions were given; and if these vessels were covered over with a fine glazing; they would be as perfect porcelain as that of Japan. The most perfect porcelain, therefore, is nothing else than a fine white stone-ware.

The French stone-ware, or *poterie de gre*, is formed of a whitish clay, in which a good deal of fine white sandy particles is intermixed. The English stone-ware is composed generally of tobacco-pipe-clay and ground flints. This ware, when sufficiently burnt, has, as well as the French, those qualities of porcelain which are most essential; namely, strength, hardness, the property of sustaining the heat of boiling water, and infusibility.

The principal fault of the English porcelain appears to be in the glazing, which is apt to crack, by the continual adhibition of hot water. Even in this point, however, considerable improvements have taken place of late years. There is now scarcely a county in England without its manufactory of porcelain. Those of the highest order are in Staffordshire, Worcestershire, and Derbyshire, and at Swansea, in Glamorgan-shire, where it is said there has lately been discovered a species of clay, which enables the proprietor to manufacture porcelain, that has all the properties of the famous porcelain of Sévres.

The basis of the porcelains is called by artists a *fritt*. It is nothing else than a mixture of sand, or of powdered flints, with salts capable of disposing them to fusion, and of giving them a great whiteness by means of a sufficient heat. This *fritt* is to be then mixed with as much of a white tenacious earth, of an argillaceous or marly nature, as is sufficient to make it capable of being worked upon the wheel, and no more. The whole mixture is to be well ground together in a mill, and made into a paste, which is to be formed, either upon the wheel or in moulds, into pieces of such forms as are required.

Each of these pieces, when dry, is to be put into a case made of earthen-ware. These cases are called by English potters *saggars*, which is a corruption of the word *safe-guard*. They are generally formed of coarser clays, but which must also be capable of sustaining the heat required without fusion. By means of these cases the contained porcelain is preserved from the smoke of the burning fuel. The whiteness of the porcelain depends much on their compactness of texture, by which the smoke is excluded, and on the purity of the clay of which they are made. These cases are to be ranged in piles one upon another, in a furnace or kiln, which is to be filled with them to the roof. The furnaces are chambers or cavities of various forms and sizes, and are so disposed, that their fire-place is on the outside, opposite to one or more openings which communicate within the furnace. The flame of the fuel is drawn within the furnace, the air of which rarefying determines a current of air from without inwards, as in all furnaces. At first a very little fire is made, that the furnace may be heated gradually; and is to be increased more and more, till the porcelain is baked; that is, till it has acquired its proper hardness and transparency; which is known by taking out of the furnace from time to time small pieces of porcelain placed for that purpose in cases which have lateral openings, and examining them. When these pieces show that the porcelain is sufficiently baked, the fire is no longer to be supplied with fuel, the furnace is to be cooled, and the porcelain taken out, which in this state resembles white marble, not having a shining surface. This is afterwards to be given by covering them with a vitreous composition, called the glazing.

The porcelain when baked and not glazed, is called *biscuit*, and is more or less beautiful, according to the nature of its composition.

As no imitation of sculpture in porcelain can preserve all the delicacy of its workmanship when covered with a glazing; and as sculptors avoid polishing their marble figures, because the lustre of the polish is disadvantageous; therefore in superior ma-

nufactures, all figures, or little statues, and even some ornamental vases, are left in the state of *biscuit*. The other pieces of porcelain are to be glazed in the following manner:—

A glass is first to be composed, suited to the nature of the porcelain, to which it is to be applied, for every glass is not fit for this purpose. We frequently find, that a glass, which makes a fine glazing for one porcelain, shall make a very bad glazing for another porcelain, shall crack in many places, shall have no lustre, or shall contain bubbles. The glazing then must be appropriated to each porcelain, that is, to the hardness and density of the ware, and to the ingredients of its composition, &c. Much appears to depend on the glaze, and the body of the ware, possessing the property of equally expanding by increase of temperature: if they differ in this respect, the glaze must infallibly crack during the cooling from the furnace.

These glazings are prepared by previously fusing together all the substances of which they consist, so as to form vitreous masses. These masses are to be ground very fine in a mill. This vitreous powder is to be mixed with a sufficient quantity of water, or other proper liquor, so that the mixture shall have the consistence of cream. The pieces of porcelain are to be covered with a thin stratum of this matter, and when very dry they are to be again put into the furnace, in the same manner, as before, and to be continued there till the glazing is well fused. The necessary degree of fire for fusing the glazing is much less than for baking the paste.

The pieces of porcelain which are intended to remain white are now finished; but those which are to be painted and gilded must undergo farther operations. The colours to be applied are for the most part the same as those used for enamel painting. They all consist of metallic oxides, bruised and incorporated with a very fusible glass. The purple precipitate of gold, that bears the name of *cassius*, affords a crimson; but it requires nice management, as a little too much heat, or carbonaceous vapours, easily spoil it. If the flux contain a great quantity of lead, it will produce a violet. The crimson for soft porcelain is made with fulminating gold, gently decomposed, and muriat of silver. Red oxide of iron, prepared with nitric acid, and afterward calcined by fire, produces a red, or rose colour; but too much heat changes it brown. Yellows are composed of the oxides of lead and antimony, with sand; to which oxide of tin is sometimes added. By adding a little red oxide of iron, the fine lively colour of the *marigold* is produced. Blues are derived from oxide of cobalt; greens from oxide of copper, and sometimes from a mixture of yellow and blue. When a strong heat is required, the oxides of cobalt and nickel are

mixed, but they afford only a brownish green. Brown reds are obtained by mixing in different proportions manganese, brown oxide of copper, and amber. Oxide of manganese, brown oxide of copper, and a little oxide of cobalt, give a beautiful black, but it is liable to scale and become dull. At Sévres a fine black is made by mixing blue with the oxides of iron and manganese. In melting copper with two parts of glacial acid of phosphorus, and a twelfth part of powdered charcoal, a fine red enamel is found covering the phosphuret of copper, which would make a good colour on porcelain. These colours being ground with gum-water, or with oil of spike, are to be employed for the painting of the porcelain with designs of flowers and other figures. For gilding, a powder, or oxide of gold, is to be applied in the same manner as the coloured enamels. The painted and gilded porcelains are to be then exposed to a fire capable of fusing the glass with which the metallic colours are mixed. Thus the colours are made to adhere, and at the same time acquire a gloss equal to that of the glazing. The gold alone has not then a shining appearance, which must be afterward given to it by burnishing with a blood-stone. Silver applied in the same manner as gold would be very liable to tarnish; but platina, precipitated from its solution by muriat of ammonia, and the muriat expelled, by heat, so as to leave the platina in the form of a light grey powder, may be applied in the same manner as gold, and when burnished, will resemble silver with a slight steel cast.

The operations for the infusible porcelains, and also for such as are of the nature of stone-ware, are somewhat more simple. The sands and stones which enter into their composition are to be ground in a mill; the earths or clays are to be washed; the materials are to be well mixed, and formed into a paste: the pieces are first rudely formed upon a potter's wheel; and when dry, or half dry, they are turned again upon the wheel, or in a lathe or other engine, and their form is made more perfect: they are then placed in the furnace, not to bake them, but only to apply a sufficient heat to give them such a solidity, that they may be handled without breaking, and may receive the glazing. As the pieces of porcelain after this slight heat are very dry, they imbibe water readily. This disposition assists the application of the glazing. The vitrifiable or vitrified matter of this glazing, which has been previously ground in a mill, is to be mixed with such a quantity of water, that the liquor shall have the consistence of milk. The pieces of porcelain are hastily dipped in this liquor, the water of which they imbibe, and thus on their surface is left an uniform covering of the glazing materials. This covering, which ought to be very thin, will very soon become so dry, that it cannot

stick to the fingers when the pieces are handled.

The pieces of the porcelain are then put into the furnace to be perfectly baked. The heat is to be raised to such a height, that all within the furnace shall be white, and the cases shall be undistinguishable from the flame. When, by taking out small pieces, the porcelain is known to be sufficiently baked, the fire is discontinued, and the furnace cooled. If the baking have been well performed, the pieces of porcelain will be found by this single operation to be rendered compact, sonorous, close-grained, moderately glossy, and covered externally with a fine glazing. The painting, and gilding, of this porcelain are to be executed in a manner similar to that already described.

Within these few years our importation of porcelain, even from China, has been gradually on the decline, owing to the astonishingly rapid progress of our native manufactures in this line. The Worcester, Staffordshire, and Derbyshire china, are exported mostly to America, and to some few parts of the European continent, as well as to Ireland. — For the foreign names of porcelain, see CHINA-WARE.

PORK, the flesh of the hog. When salted and pickled, pork constitutes a considerable branch of the Irish export trade. The chief ports of Ireland whence pork is shipped, are Waterford and Cork, and from these several thousand barrels of the article are annually sent to the West Indies, &c. In the year 1808, 16,889 barrels of pork were shipped from the port of Waterford; which, at 90s. per barrel, amounted to the value of 76,900*l.* 10s.

Of the American pork that of Burlington is the best, but it is by no means equal to the Irish in flavour, neither does it keep so well, being rather flabby. It may, however, be purchased on very fair terms, and will answer the purpose of a moderate voyage extremely well, provided it be carefully cured.

PORPHYRY, (GER. *Porphyry*. DU. *Porfiersteen*. DA. and SW. *Porphyry*. FR. *Porphyre*. IT. SP. and PORT. *Porfido*. RUS. and POL. *Porfir*. LAT. *Porphyrius lapis*.) includes those stones which contain either felt-spar, schoerl, quartz, or mica, with other species of crystallized stone, on a siliceous or calcareous ground. It is found of several different colours, as green, deep red, purple, black, dark brown, and grey. When the ground is of jasper, the porphyry is commonly very hard; the red generally contains felt-spar, in small white dots or specks, and frequently together with these black spots of schoerl. The green is often magnetic, and is either a jasper or schoerl, with spots of quartz. Sometimes a porphyry of one colour contains a fragment of another of a different colour. Those that have chert for their ground, are fusible *per se*. The cal-

careous porphyry consists of quartz, felt-spar, and mica, in separate grains, united by a calcareous cement; and, lastly, the micaceous ground in which red felt-spar, and greenish soap-rock, are inserted.

The Egyptian porphyry is a most elegant mass, of an extremely firm and compact structure, remarkably ponderous, and of a fine strong purple, variegated more, or less, with pale red and white.

In Upper Egypt and Arabia Petraea, the hard, pale, red, porphyry is also found in surprising quantities; it is variegated with black, white, and green; takes a high polish, and emulates all the qualities of the oriental porphyry. The hard, red-lead coloured porphyry, variegated with black, white, and green, is a most beautiful and valuable substance. It possesses the hardness, and all the other characters, of the oriental porphyry, and even greatly excels it in brightness, beauty, and variety of hues. It is found in great quantities in the island of Minorca, and is superior to all the Italian marbles.

A species of the porphyry found in Arabia is frequently met with in some parts of England, Ireland, and Germany. A kind of porphyry, called sonorous, is found in the mountains of Bohemia, and Upper Lusatia, and in the county of Fulda. It is of a grey colour, sometimes approaching to green, and of a foliaceous fracture. When broken, it has a sound almost metallic. The art of cutting porphyry is now lost, though the ancients appear to have practised it with success, in fashioning those large columns, and other works of porphyry, in some of the buildings at Rome.

The French say that they can form the whole *contour* of a column from porphyry,

by means of an iron saw without teeth, and grez, a kind of freestone pulverized, and water.

PORT, the name of a red wine, so called from Oporto or 'Porto, a city and sea-port of Portugal, whence immense quantities of the article are annually exported, almost exclusively to Great Britain. The wine which yields the port wine was originally brought from Burgundy, but the transplantation has had so wonderful an effect upon it, that scarcely any thing can be more distinct from the wines of Burgundy, than that of Oporto. The latter is usually of a remarkably strong body, of a rough and agreeably acid flavour, and its effects are rather stupefying, than exhilarating. Prior to its being exported, it is always well brandied; but it is to be observed, that the wine shipped to Ireland is never so much brandied as what is brought into this country. The wine-consumers of the sister-kingdom have long been used to the luxury of claret, and this will serve to account for the preference they give to light ports, which come nearest to the French wine just mentioned. The merchants of Southampton have been in the habit of importing peculiarly light port wines, whence the English dealers denominate this description of the article, *Southampton port*.

PORT, a harbour, or place of shelter, where ships arrive with their freight, and customs from goods are taken.

Gravesend is usually considered as the boundary of the port of London.

For account of the chief trading ports the World, see EUROPE, ASIA, AFRICA, and AMERICA.

For laws respecting ports in the British dominions, see title HARBOURS, IMPORTATION, and NAVIGATION.

A LIST OF THE PORTS OF ENGLAND AND WALES, WITH THEIR MEMBERS AND CREEKS.

N. B. *Members* are those places where anciently a custom-house had been kept, and where officers, or their deputies, attend, as they are lawful places of exportation and importation.

Creeks are places where commonly officers are, or have been placed, by way of prevention, not out of duty, or right of attendance, and are not lawful places of importation, or exportation, without a particular licence or sufferance, from the port or member under which it is placed.

PORTAGE is also a duty paid upon different sorts of packages at the port of London. For the rates of portage, *see* PACKAGE, App.

PORT-CRAYON, a case for a pencil, usually four or five inches long, wherein a pencil slides up, and down, by means of a spring, and button. Its outside is filled in eight faces, whereon are drawn the sector lines; its inside is generally round.

PORTERS and PORTERAGE. The London porters are divided into brotherhoods, and consist of four sorts, viz. ticket-porters, fellowship-porters, tackle-porters, and company's porters.

All the ticket-porters must be freemen, and must give security for their honesty and fidelity; they are so called from wearing a ticket at their girdle, with their names stamped thereon.

Their business consists in shipping, and landing, merchandise, exported or imported, also in housing merchants' goods, &c.

The employment of the fellowship-porters is to land, ship off, carry, re-carry, or house all merchants' wares; such as corn, salt, coals, and other commodities that are measurable by dry measure.

These are upwards of 700 in number, and their governor is the alderman of Billingsgate ward.

Tackle-porters are such of the ticket-porters, as are provided with weights, scales, &c. and their business consists in weighing goods, &c.

They land, and ship off, all goods and merchandise, exported, and imported, to or from all parts near the west side of the Sound, or the Baltic Sea, Holland, France, Spain, Italy, Germany, Turkey, and all towards or beyond the Cape of Good Hope.

Any person has liberty to bring any goods into London; but he must neither take up,

nor carry, any within the city, otherwise he will be liable to be fined.

By Stat. 39 Geo. 3. c. 58, no innkeeper, warehouse-keeper, or other person, to whom any box, basket, package, parcel, truss, game, or other things whatsoever, not exceeding fifty-six pounds weight, or any porter or other person employed by such innkeeper, warehouse-keeper, or other person, in portorage or delivery of any such box, parcel, &c. within the cities of London, Westminster, or borough of Southwark, and their respective suburbs, and other parts contiguous, not exceeding half a mile from the end of the carriage-pavement, in the several streets and places in the above-mentioned limits, shall ask or demand, or receive or take, in respect of such portorage or delivery, any greater rate or price than as follows:

	s. d.
For any distance not exceeding one quarter of a mile	0 3
Not exceeding half a mile	0 4
Not exceeding one mile	0 6
Not exceeding one mile and a half	0 8
Not exceeding two miles	0 10
And so in like manner the additional sum of 3d. for every further distance not exceeding half a mile.	

Persons asking or receiving more than the above rates, shall, for every such offence, forfeit a sum not exceeding 20s. nor less than 5s.

PORT-HOLES, in a ship, are the holes in the side of a vessel, through which are put the muzzles of the great guns. These are shut up in storms, to prevent the water from driving through them. The English, Dutch, and French ships have the valve or casements fastened at the top of the port-holes, and the Spanish vessels on one side.

PORTLAND-STONE, a free-stone found in Portland, a peninsula in Dorsetshire. Nicholson calls it a compact sand-

stone, and tells us that its cement is calcareous. It is of a dull white, will not strike fire with steel, but effervesces violently with nitric acid. Portland-stone is mostly brought to London, for the structure of the finest edifices. St. Paul's church, in particular, is built of this stone.

PORTMANTEAU, a small trunk, generally of a roundish form, and either formed entirely of leather, or composed of a wooden chest, covered with leather, or hide in the hair.

PORTRAIT-PAINTING. See PAINTING.

POSTAGE and POST-OFFICE. The outline of the present establishment of the general post-office was traced out by Mr. Edmund Prideaux, in the year 1642, who being appointed post-master, first established a weekly conveyance of letters into all parts of the country, whereby the charge of 7000*l.* per annum was saved to the public.

In the year 1654, a regular post-office was established by the Protector and his parliament, for the regulation of which, various acts of parliament have been since passed.

About the year 1784, a great improvement was made in the mode of conveying the mails upon a plan first suggested in 1782, by Mr. John Palmer, of Bath, who proposed that government, (instead of sending the mails in the old mode, by a boy on horseback, and in carts,) should contract with the masters of coaches to carry the mail, along with a guard, for its protection. This plan was at last established, and gradually extended to many different parts of the kingdom; and, upon a fair comparison, it appeared that the revenue was very considerably improved, though Mr. Palmer's numerous reforms, and the great number of new appointments which they rendered necessary, greatly increased the former expence of management. The conveyance of the mails on the new plan was contracted for, after the two first years trial, at 20,000*l.* per annum less than the sum first estimated by Mr. Palmer.

The present establishment of the general post-office for Great Britain consists of one postmaster-general; the salary of one of the two persons who, for many years past, have performed the duties of joint postmasters-general, having been recently abolished by parliament; a secretary, upwards of 150 assistants, and clerks for the head letter-office in London, under the direction of a superintending president of the inland-letter department; and a comptroller of the foreign-letter office. Near 600 deputy-postmasters throughout the kingdom, act under one principal, and nine riding surveyors. There are also distinct offices and clerks, acting under an accountant-general, and a receiver-general; as well as a separate establishment for the two-penny, formerly the penny-post, which has been new mo-

delled and greatly improved in all its branches. There is likewise a postmaster-general of Scotland, with a secretary, comptroller, surveyors, and a separate establishment of all the requisite officers and clerks at Edinburgh, acting under the orders of the joint postmasters-general at London.

LAWS RELATING TO THE POST OFFICE.

The postmaster-general does not come under the denomination of a carrier, for he enters into no contract, and has no hire; the postage of letters being an article of revenue, and not a mere reward for the conveyance. He is therefore, not liable to constructive negligence. *Coup. R.* 754.

But the safety of letters by the post is provided for, by numerous statutes; and for inferior offences, which do not amount to absolute crimes, by the regulations of the general post office, all inferior officers are punished by dismissal, on complaint to the postmaster-general, or his deputies.

The early statutes for the protection of letters, before mail-coaches were invented, still apply to those roads, on which such coaches are not established. The first necessary to be noticed is 5 Geo. 3. c. 25, which enacts that if post-boys conveying the mail-bag, shall quit the mail, or suffer any other person to ride on the horse or carriage, or shall loiter on the road, or not, if possible, convey the mail at the rate of six miles an hour, shall, on conviction before one justice, on oath of one witness, be sent to the house of correction for not exceeding one month, nor less than 14 days. For unlawfully collecting letters to convey them, being convicted in like manner, shall forfeit for every such letter 10*s.* to informer, and be committed for two months, mitigable to one. And any persons entrusted to take in letters and receive the postage, embezzling, or employing to their own use, the same; or burning or destroying said letters; or advancing the rates of postage, and not accounting for the money; shall be guilty of felony.

7 Geo. 3. c. 5. extends the punishment to all persons whether employed in the business of the post-office, guilty of the like offences, and for stealing out of any letter, any bill, note, or other security for money, and makes the offence felony without benefit of clergy. This statute did not extend to embezzling money itself, or to parts of securities. 2 East. P. C. c. 16.

42 Geo. 3. c. 81. extends the punishment of felony without benefit of clergy to all such persons, stealing parts of notes, bills, and other securities out of letters, as also to all persons buying or receiving the same; and the accessories may be tried whether the principals be apprehended or not, and the offence may be tried either where the offence was committed, or the offender apprehended.

And by the same statute, if any person shall wilfully secrete, or detain, or refuse to deliver to any officer of the post-office authorized to demand the same, any letter or bag of letters intended to be conveyed by the mail, which he shall have found or picked up, or which shall by accident or mistake have been left with any other person, he shall be guilty of a misdemeanor, and punished by fine and imprisonment.

By 52 Geo. 3. c. 143. if any deputy, clerk, agent, letter-carriers, post-boy or rider, or any other officer employed by or under the post-office, on receiving, stamping, sorting, changing, carrying, conveying, or delivering letters or packets, in any way relating to the post-office, shall secrete, embezzle, or destroy any letter, packet, or bag or mail of letters, which shall have come into his hands in consequence of such employment, containing the whole, or any part of any bank note, bank post bill, bill of exchange, exchequer bill, South Sea or East India bond, dividend warrant of the same, or any other company, society, or corporation; navy or victualling, or transport bill; ordnance debenture, seaman's ticket, state-lottery ticket, or debenture, bank receipt for payment on any loan, note of assignment of stock in the funds, letter of attorney for receiving dividends or selling stock in the funds, or belonging to any company; American provincial bill of credit, goldsmiths' or bankers' letter of credit, or note relating to the payment of money, or other bond, warrant, draft, bill, or promissory note whatever, for payment of money; or shall steal and take out of any letter, with which he shall have been so entrusted, or which shall have come to his hands, the whole, or any part, of any such bank note, bank post bill, &c. shall be guilty of felony without benefit of clergy.

And if any person shall steal or take away from any carriage, or from the possession of any person employed to convey letters sent by the post, or from any receiving house for the post-office, or from any bag or mail, sent or to be sent by the same, any letter, packet, bag, or mail, shall suffer death without benefit of clergy.

And all persons who shall counsel, command, hire, persuade, promise, aid, or abet such persons, or shall with a fraudulent intention buy or receive any such securities, instruments, &c., shall suffer in like manner; accessories may be tried before apprehension or trial of principals. Trials may be in county where offenders are apprehended.

The statutes for regulating the rates of postage, and the exemptions from postage from the 9th Anne to the 53d of Geo. 3. are too numerous to be inserted, but the principal regulations of them are the following.

The King, the persons filling the princi-

pal offices of government, the public boards, and the post-office, shall send and receive letters duty free.

Also all members of either house of parliament during the sitting of the same, or within 40 days before, or after, any summons, or prorogation, not exceeding one ounce in weight, on condition that the names of the member, and the post town from which sent, the day of the month at full length, and the year, shall be indorsed thereon; also that the member directing it shall be at, or within 20 miles, of the post town, or the day, or day before, the letter is put into the post-office; and also on condition that no member send more than ten, or receive more than fifteen, letters in one day.

Printed votes of parliament, newspapers in covers open at the sides, and directed *by* or *to* any member, &c. are exempt from postage.

But the postmasters may search to see if any thing else be contained in the cover, and if there be any such found, it shall be charged treble postage.

Persons altering the superscription of franked letters, or counterfeiting the handwriting of members on them to avoid postage, guilty of felony, and to be transported for seven years.

But nevertheless, members who from infirmity are unable to write, may authorise and depute another to frank for them, sending notice thereof under hand and seal, attested by a witness, to the postmaster-general.

Bills of exchange, invoices, merchants' accounts, &c. written on same piece of paper with a letter, or several letters written to several persons on one piece of paper, to pay as so many distinct letters, or by the ounce.

So writs or other legal proceedings.

Patterns and samples of goods in covers open at the sides without any writing inside, to be charged as single letters. But, by 52 Geo 3. if not open at the sides, and weighing only 1 oz., an additional rate of 2d, but if less than 1 oz. and open at the side only, the additional rate of 1d.

Foreign letters suspected to contain prohibited goods may be opened in the presence of a justice, or magistrate, of the place, or district, on oath of person suspecting. If contraband goods found, to be destroyed, and the letter sent to the commissioners of customs; if none found, the letter to be forwarded with an attestation of the circumstances by the justice, or magistrate.

By 9 Anne, c. 10. No person except the postmaster, and persons authorized by him, shall carry or convey any letters on pain of 5l. for every offence, and a penalty of 100l. per week besides, to be recovered in any court of record. And by 42 Geo. 3. c. 81. No person shall send or tender, or deliver to be sent, otherwise than by the authority

of the postmaster or his deputies, or to the nearest or most convenient post town to be forwarded by the post, any letter or packet, on pain of 5*l.* to be recovered in any court of record at Westminster.

Except letters *concerning goods* to be delivered *with such goods*, sent by a common carrier; letters of merchants, owners of ships or merchant vessels with cargoes to be delivered; such letters being carried without hire or reward; any commission or return thereof; process or return thereof out of any court, or any letter sent by any private friend in their way of journey; or by any messenger sent on purpose concerning private affairs.

Postmasters may make private agreements with persons living in places (not being post towns) for the receiving and sending to them respectively, letters to and from the post town; but for the delivery of letters within the limits of the post town, he is entitled to no remuneration. 5 *Burr. R.* 2709.

The Rates of the General Post, as they stood regulated by Statute previous to 52 Geo. 3.

Single Letters.

	oz. weight.			
	s.	d.	s.	d.
From any post-office, to any place not exceeding 15 miles - - -	0	3	1	0
Above 15 and not exceeding 30 miles - - -	0	4	1	4
Above 30 and not exceeding 50 miles - - -	0	5	1	8
Above 50 and not exceeding 80 miles - - -	0	6	2	6
Above 80 and not exceeding 120 miles - - -	0	7	2	4
Above 120 and not exceeding 170 miles - - -	0	8	2	6
Above 170 and not exceeding 230 miles - - -	0	9	3	0
Above 230 and not exceeding 300 miles - - -	0	10	3	4

For 100 measured miles above 300 miles, a further sum of 1*d.* ounce 4*d.*—Above 500 measured miles, and not amounting to 100 miles, the like further sum for every letter 1*d.* ounce 4*d.*—And where the distance above 300 measured miles shall not exceed 100 miles, and so progressively for any like excess of distance of 100 miles, the like further sum for every letter 1*d.* ounce 4*d.*

Irish Letters.

Every letter conveyed by packet-boats from or to the ports of Milford Haven, to or from any ports in Ireland, over and above the rates payable for such letters, a packet-postage, viz. for every letter 2*d.* ounce 8*d.*

Single letters to soldiers and sailors, under certain restrictions, are chargeable with 1*d.* only.

Foreign Letters.

No letters for foreign parts can be forwarded, unless the postage of such letters be first paid.

	s. d.	
To Portugal - - -	2	2
To Spain - - -	1	10
Switzerland, and any part of Italy, via France - - -	1	7
To France - - -	0	10
To all other parts on the Continent - - -	1	4

And so in proportion for double, treble, and ounce weight.

Newspapers and other periodical publications may be procured from all parts of the Continent, by application at the foreign post-offices, whither also orders for forwarding English newspapers must be sent.

Additional Rates by 52 Geo. 3. c. 88.

For the port and conveyance of letters by the post within Great Britain, above the distance of twenty miles from the office where such letters may be put in, to the office where the same may be directed,

For every single letter - - -	1 <i>d.</i>
For every double letter - - -	2 <i>d.</i>
For every treble letter or other letter under an ounce in weight - - -	3 <i>d.</i>
And for every ounce in weight, and for every packet not exceeding an ounce in weight, (and so in proportion for every other letter or packet of greater weight than an ounce) - - -	4 <i>d.</i>
For the port and conveyance of letters by the post to and from Ireland,	
For every single letter - - -	1 <i>d.</i>
For every double letter - - -	2 <i>d.</i>
For every treble letter or other letter under an ounce in weight - - -	3 <i>d.</i>
And for every ounce in weight, and for every packet not exceeding an ounce in weight, (and so in proportion for every other letter or packet of greater weight than an ounce) - - -	4 <i>d.</i>

For the port and conveyance of letters by the post to and from his majesty's dominions and plantations in America, For every single letter an additional rate of 2*d.*
For every double letter - - - 4*d.*
For every treble letter or other letter under an ounce in weight - - - 6*d.*
And for every packet not exceeding an ounce in weight, (and so in proportion for every other letter or packet of greater weight than an ounce) - - - 8*d.*

And for the port and conveyance of letters by the post to and from parts beyond the seas, whether within his majesty's dominions, or not within his majesty's dominions,
For every single letter an additional rate of - - - 2*d.*
For every double letter - - - 4*d.*
For every treble letter or other letter under an ounce in weight - - - 6*d.*

And for every packet not exceeding an ounce in weight, (and so in proportion for every other letter of greater weight than an ounce) - 8d.

Not to extend to letters to and from isles of Guernsey, Jersey and Man, except for the conveyance *within* Great Britain.

For every letter or packet containing samples or patterns, to the said places, *not open* at the sides, an additional rate of 2d.

For every such open at the sides ditto 1d. if the same do not weigh 1 oz.

Not to extend to letters sent by, or to, seamen and soldiers, under 35 Geo. 3. c. 53.

See 1 Geo. 4. c. 89. for rates on letters between Port Patrick, Scotland, and Donaghadee, Ireland.

See 1 & 2 Geo. 4. c. 35. § 19, 20. for rates on letters to any part of Great Britain or Ireland, by way of Chester and Conway.

See 3 Geo. 4. c. 105. for rates on letters between Liverpool and the Isle of Man.

Rates of the Two-penny Post.

For every letter (not first passing by the general post), the postage whereof shall not be paid on putting the same into the office of the said post, the rate hereinafter-mentioned shall be paid, viz. —

Every letter from any place within London and Westminster, Southwark, and their respective suburbs - 2d.

Every letter to be forwarded by the general post - 2d.

Every letter first passing by the general post, and then by two-penny post, over and above the general postage 2d.

Merchants' accounts, bills of exchange, and bills of lading, shall be rated as so many several letters.

Letters sent to and from London, within a distance not exceeding ten miles 3d.

Rates of Postage between London and the Cape of Good Hope, Mauritius, and the East-Indies, by 55 Geo. 3. c. 153.

For every single letter - 3s. 6d.
double do. - 7s. 0d.
treble do. - 10s. 6d.

And for every ounce in weight 14s. 0

And so in proportion for letters and packets above the weight of 1 oz.

For every letter or packet conveyed between the Cape of Good Hope, or the Mauritius, and any part of the continent of Asia; and between the Cape of Good Hope, or the Mauritius, or the continent of Asia, and all intermediate places, and between all the intermediate places respectively.

For every single letter - 1s. 9d.
double do. - 3s. 6d.
treble do. - 5s. 3d.

And for every ounce in weight 7s. 0d.

And so in proportion, &c.

And newspapers, printed prices current,

or any papers liable to stamp duty, and duly stamped, not exceeding 1 oz. in weight, may be conveyed from London to any of the above places, paying for each - 5d.

The East-India Company not to charge any postage, except for *inland* postage in India, and for any sealed bags or packages which may be sent by the postmaster-general, by ships of the Company.

A mail shall be sent by the postmasters-general to India, &c. monthly; and any wilful delay of sailing shall be punished by a fine of 500l.

Persons conveying letters to India, &c. without the authority of postmasters-general, liable to a penalty of five pounds for every such letter so conveyed.

There are exceptions in favour of the directors of the India Company; of such public officers as have been used to receive letters to and from India, &c. duty free; of seamen and soldiers, privileged by 46 Geo. 3. c. 92.; and of owners, charterers, and consignees of vessels, under certain restrictions, by their own ships.

Letters to and from China are declared not to be within the act.

The increase in the revenue of the post-office within the last seven years almost exceeds credibility. In the four last years of the reign of Geo. I. the whole produce was 75,545l.

Of the single year, ending Jan. 5. 1828. 1,359,000l.

POST ENTRY. When goods are weighed or measured, and the merchant has got an account thereof at the custom-house, and finds his entry, already made, too small, he must make a *post* or additional *entry* for the surplusage, in the same manner as the first was done. As a merchant is always in time, prior to the clearing of the vessel, to make his post, he should take care not to over-enter, to avoid as well the advance, as the trouble of getting back the overplus. However, if this be the case, and an over-entry has been made, and more paid or bonded for customs, than the goods really landed amount to, the land-waiter and surveyor must signify the same, upon oath made, and subscribed by the person so over-entered, that he, nor any other person, to his knowledge, had any of the said goods over-entered on board the said ship, or any where landed the same without payment of custom; which oath must be attested by the collector and comptroller, or other deputies, who then compute the duties, and set down on the back of the certificate, first in words at length, and then in figures, the several sums to be paid.

The following is the form of the CERTIFICATE, necessary to be made in this case, with the indorsement:—

"These are to certify that James Fletcher

did pay his majesty's duties inwards in the Augustus, Thomas Wilson, master, from the Sound, the 9th day of August, 1809, for a hundred and twenty-four tons of iron; and we the officers underwritten did examine the same at the delivery thereof out of the said ship, and found no more than a hundred and eighteen tons of iron; and for further manifestation of the truth hereof, he made oath, that neither he nor any other person, to his use or knowledge, had these goods over-entered on board the said ship, or in any place landed them, without paying customs. Dated at the Custom-house, London, the 25th day of August, 1809.

"THOMAS BARKER, Surveyor.

"J. GREENHALL, Land-Waiter.

"*Jurat*, James Fletcher, that the contents of the above certificate are true."

The indorsement contains a specification of the duties paid, with a deduction of the overplus.

POSTING, in book-keeping, is the mode of transferring articles of different descriptions from the inferior to the superior books of accounts, and there arranging them under their proper heads. See **BOOK-KEEPING**.

POST-PAPER, (GER. and DU. *Postpapier*. DA. *Postpapier*. SW. *Postpapper*. FR. *Papier fin à lettres*. IT. *Carta fina per lettere*. SP. and PORT. *Papel fino*. RUS. *Potschtowaja bumaga*. POL. *Poztowy papier*.) is a name given to the fine paper used in letter-writing. It has obtained this appellation from letters being usually forwarded by the post.

POTS, (GER. *Töpfe*. DU. *Potten*. DA. *Potter*. SW. *Pottor*. FR. *Pots*. IT. *Stoviglie*. SP. *Ollas*. PORT. *Panellas*. RUS. *Gorschokii*. POL. *Garnki*.) well known vessels usually employed for culinary purposes, and made for the most part, of iron, copper, or brass. Articles of this kind are principally manufactured at Birmingham, Sheffield, Wolverhampton, &c.

POT-ASH, (GER. *Pottasche*. DU. *Potas*. DA. *Potaske*. SW. *Potaska*. FR. *Potasse*. IT. *Potassa*. SP. and PORT. *Potassa*. RUS. *Potasch*. POL. *Potasz*. LAT. *Cineres clavelati*.) an alkaline salt, chiefly procured by lixiviation, from the ashes of burnt wood, and other vegetable substances. When pure, it is in form of a whitish powder, of a highly acrid taste, and quickly destroys animal bodies. It is readily soluble in water, and quickly deliquesces when exposed to the air, by attracting its moisture: it also absorbs a portion of carbonic acid from the atmosphere, and becomes altered in its properties, being changed into a nearly neutral, and more mild, salt. In this state it is readily crystallizable.

Pot-ash is of great use in the arts. It is employed in bleaching, making alum, scouring wool; in dyeing, and calico-printing;

for making glass and soap; though soda is usually employed for the two latter purposes. It is also of considerable importance in chemistry and medicine.

POTASSIUM. This name was given by Sir H. Davy to the metallic base of potash. It is solid at the usual temperature of the atmosphere, but quickly becomes soft and malleable by the warmth of the hand; it is perfectly white, and has the lustre of polished silver; but it is quickly tarnished on exposure to the air. Its specific gravity is only .865; it fuses at 150° of Fahrenheit, and becomes volatile at a temperature below that of a red heat. It has not been applied to any use in the arts.

POTATOE, (GER. *Kartoffeln*. DU. *Aardappelen*. DA. *Patater*, *Jordæbler*. SW. *Potatos*, *Jordpärön*. FR. *Pommes de terre*. IT. *Patate*, *Pomi di terra*, *Tartufoli*. SP. *Patatas manchegas*, *Patatas inglesas*, *Comotes*. PORT. *Batatas di terra*, *Pomes de terra*. RUS. *Jabloki semleniue*, *Kartoflu*. LAT. *Tubera virginiana esculenta*.) it is generally supposed, came originally from the province of Virginia, in North America, and it is said was brought into Ireland by Sir Walter Raleigh: others deny this, and say potatoes were not known in North America till long after that period. These writers trace their origin to, South America, from which country, they say, they were brought into Italy, long before they were known in any other part of Europe. Be these different accounts entitled to what credit they may, the root was first introduced into Ireland, we are told, about 1565, and thence was brought to England. It was forty years after their introduction, however, before they were much cultivated about London; and prior to 1663 they did not come into general use. The utility of potatoes, as food for man, and cattle, is well established. The peasantry of Ireland have scarcely any nutriment beside what this plant affords them; yet there are not more hardy, robust, or hale people in the dominions of his Britannic majesty. Instances of the amazing increase of potatoes are very numerous. There are either a prodigious number of different species, or great varieties of the same species; but, for any thing that appears to the contrary, they are all, under similar circumstances of culture, equally prolific, and equally nutritive in quality. Nor is the only part of the produce of this plant, which is valuable, at its root; for it has been recently discovered that the apple, which is borne on its stem, abounds with a saccharine juice, which yields largely a powerful spirit, on distillation. The usual time for planting the potatoe is in April, and May; and of gathering the crop, September and October: but they will produce, with proper care, at all periods of the year; and the same ground, well dug and manured, will

produce two crops in a year. The less the plant is suffered to luxuriate above ground, the more will be the produce at the root, at least so most modern experiments induce us to believe. This article is exported, usually in wicker-baskets, to Gibraltar, the Mediterranean, and the West Indies.

POTTE, a Danish liquid measure.

POTTER'S CLAY, (GER. *Töpfererde*. Du. *Potlärde*. DA. *Potteleer*. Sw. *Krukoma-kare-lera*. FR. *Terre à potier*, *Terre glaise*. IT. *Terra da stoviglie*. SP. *Tierra de alfareros*. PORT. *Barro*. RUS. *Barro*. PRUS. *Glina*. POL. *Glina zdunska*.) a denomination applied to the different species of clay used in the manufacture of pottery. Staffordshire, and some other parts of England, are wonderfully rich in clay of this description. See POTTERY and PORCELAIN.

POTTER'S ORE. (GER. *Bleyglauz*. Du. *Lootglans*. DA. *Blyglands*. Sw. *Blyglans*. FR. *Arquifou*. IT. *Archifoglio*. SP. *Alquifol*. PORT. *Arquifolho*. RUS. *Kubikowataia ruda*, *Bleiglanz*. LAT. *Galena*.) See ALQUIFOU.

POTTERY, the manufacture of earthenware, or the art of making earthen vessels. In a general sense, therefore, it applies to all the different branches.

All kinds of pottery are made of clays or argillaceous earths, because these earths are capable of being kneaded, and easily receiving any form, and of acquiring much solidity and hardness by exposure to fire. But clays differ much in the effects produced upon them by fire. Some, which are of the purest kind, resist the most violent fire, without receiving any other change than a considerable hardness; but still they are not rendered so compact as other clays. A second kind, by exposure to violent heat, acquires a hardness equal to that of flints, and a texture compact and glossy, like that of good porcelain; but remains nevertheless infusible by the most violent heat. These qualities are occasioned by the intermixture of some fusible materials, as sand, chalk, gypsum, or ferruginous earth, which are in too small a quantity to effect a complete, but only a beginning, or partial, fusion. Lastly, a third kind of clays is first hardened by fire, and afterwards completely fused. This last kind evidently contains the largest quantity of the fusible matters above mentioned.

From the properties of these three principal clays it may be concluded, that, from clays alone, three principal kinds of pottery may be produced. With the first kind of clay, pots or crucibles may be formed, capable of sustaining the most violent fire without fusion, of containing melted metals, and even hard glasses, not too fluid; but which, from want of sufficient compactness, are incapable of containing, during a long

time in fusion, very fusible substances, such as nitre, glass of lead, glasses containing much arsenic, &c. by which substances their pores are pervaded. These clays are employed advantageously for the formation of large pots or crucibles used in glass-houses for containing hard glass, as bottle-glass.

With clays of the second kind may be made crucibles and other potteries, commonly called stone ware. Potteries made with these earths, when sufficiently baked, are very sonorous, so hard as to strike fire with steel, capable of containing all liquids, of which the former kind, from their porosity, are incapable, and even resist the action of nitre, glass of lead, and other fluxes, when the earth of which they are formed is of good quality: but their hardness and density, which prevent their sudden expansion and contraction, by the hasty application of heat and cold, make them liable to break in all operations where they are suddenly exposed to these extremes; as, for instance, in a furnace through which a strong current of air passes. If this kind of pottery had not this inconvenience, it would be the best and most perfect for the purposes of ordinary life, as well as for chemistry. Notwithstanding this inconvenience, it is the only pottery that is applicable on many occasions; but then all possible care must be taken to prevent its breaking, by a very gradual application of heat and cold, and by protecting it from currents of cold air.

With the fusible clays may be made many kinds of vessels, which are cheap, as they require little fire to bake them; for all this kind of pottery is but slightly baked; whence its texture is coarse and porous. Some utensils are made of this pottery without glazing; but in general they are covered with a glazing, without which, water, or other liquids, would pass through their pores. Some of this pottery, which is finished with more care, is covered with a white enamel, which makes it very neat, and like porcelain. This is called DELFT WARE, *which see*. Other coarser potteries of this kind are glazed with glass of lead mixed with metallic oxides, or fusible coloured earths, from which they receive various colours. This is the ordinary pottery.

A fine kind of pottery is made of white clays, or of such as whiten in the fire, the surface of which is vitrified by throwing into the furnace, when the ware is sufficiently baked, some common salt, and salt-petre. This pottery is called English ware on the Continent, because the first and best was made in England. It is white, fine, well baked, and has some small degree of transparency when thin; so that it is intermediate betwixt porcelain and common stone-ware, and may therefore be called a semi-porcelain.

As the English stone-ware is composed of tobacco-pipe-clay and ground flints, both

which substances are perfectly infusible, singly or jointly, it cannot possess any degree of transparency. The use of the flint is to give strength to the ware, so that it shall preserve its form during the baking : whereas vessels made of clay alone, though infusible by fire, and capable of acquiring, by having been exposed to an intense heat, the hardness of the best porcelain ; yet, while they are hot and soft, they sink by their own weight, so as to lose the form given them. The process of manufacturing this stone-ware, is as follows : —

Tobacco-pipe-clay is beaten much in water ; by this process, the finer parts of the clay remain suspended, while the coarser sand, and other impurities, fall to the bottom. The thick liquid, consisting of water and the finer parts of the clay, is further purified by passing through hair and lawn sieves, of different degrees of fineness. After this, the liquid is mixed (in various proportions for various wares) with another liquor, of, as nearly as may be, the same density, and consisting of flints calcined, ground, and suspended in water. The mixture is then dried in a kiln ; and being afterward beaten to a proper temper, it becomes fit for being formed at the wheel into dishes, plates, bowls, &c. When this ware is to be put into the furnace to be baked, the several pieces of it are placed in the cases made of clay, called seggars, which are piled one upon another, in the dome of the furnace : a fire is then lighted ; and when the ware is brought to a proper temper, which happens in about forty-eight hours, it is glazed by common salt. The salt is thrown into the furnace, through holes in the upper part of it, by the heat of which it is instantly converted into a thick vapour ; which, circulating through the furnace, enters the seggar through holes made in its side (the top being covered to prevent the salt from falling on the ware), and attaching itself to the surface of the ware, it forms that vitreous coat upon the surface, which is called its glaze.

The yellow, or queen's ware, is made of the same materials as the flint-ware ; but the proportion in which the materials are mixed is not the same, nor is the ware glazed in the same way. The flint-ware is generally made of four measures of liquid flint, and of eighteen of liquid clay : the yellow ware has a greater proportion of clay in it ; in some manufactories they mix twenty, and in others twenty-four, measures of clay, with four of flint. These proportions, if estimated by the weight of the materials, would probably give, for the flint-ware, about three hundred weight of clay, to one hundred weight of flint, and for the yellow ware somewhat more clay. The proportion, however, for both sorts of ware, depends very much upon the nature of the clay, which is very variable even in the same pit. Hence a previous trial must be made of the quality

of the clay, by burning a kiln of the ware. If there be too much flint mixed with the clay, the ware, when exposed to the air after burning, is apt to crack ; and if there be too little, the ware will not receive the proper glaze from the circulation of the salt vapour.

This glaze, even when it is most perfect, is in appearance less beautiful than the glaze on the yellow ware.

The yellow glaze is made by mixing together in water, till it becomes as thick as cream, 112 lb. of white lead, 24 lb. of ground flint, and 6 lb. of ground flint glass. Some manufactories leave out the glass, and mix only 80 lb. of white lead, with 20 lb. of ground flint : and others observe different rules.

The ware, before it is glazed, is baked in the fire ; by which process it acquires the property of strongly imbibing moisture ; it is therefore dipped in the liquid glaze, and suddenly taken out ; the glaze is imbibed into its pores, and the ware presently becomes dry. It is then exposed a second time to the fire, by which the glaze it has imbibed is melted, and a thin glassy coat is formed upon its surface ; the colour of which coat is more or less yellow, according as a greater or less proportion of lead has been used. The lead is principally instrumental in producing the glaze, as well as in giving it the yellow colour ; for lead, of all the substances hitherto known, has the greatest power of promoting the vitrification of others with which it is mixed. The flint serves to give a consistence to the lead during the time of its vitrification, and to hinder it from becoming too fluid, and running down the sides of the ware, and thereby leaving them unglazed.

The yellowish colour which lead gives, when vitrified with flints, may be wholly changed by very small additions of other mineral substances. Thus, to give one instance : the beautiful black glaze, which is fixed on one side of the ware made at Nottingham, is composed of twenty-one parts, by weight, of white lead, five of powdered flints, and three of manganese. The queen's ware at present made, is much whiter than formerly.

The coarse stone-ware, made at Bristol and some other places, consists of tobacco-pipe-clay, and sand, and is glazed by the vapour of salt, like Staffordshire flint-ware ; but it is far inferior to it in beauty.

Many other modes of glazing, have been suggested, and some even tried, with various success ; as levigated green glass, and pumice-stone ; a strong solution of sea-salt ; the smoke of coal ; and various other things, among which may be reckoned, the residuum left after distilling oxygenized muriatic acid, ground with sand, which makes a good dark bronze-coloured glaze, free from the noxious qualities imputable to lead.

But the truth is, that different kinds of pottery require such different kinds of glazing, that there is no laying down any general directions, or even recommending any general recipe. It is, however, important to observe, that if any thing could be substituted for the white lead, it would be highly desirable, as many fatal accidents, it is well known to medical persons, have ensued from baking acid fruits in new vessels of queen's ware glazed with that article.

The glaze of earthen ware may have several defects; it may be scratched, more, or less, readily by a hard body; weak acids, such as vinegar, lemon-juice, verjuice, &c. may attack and dissolve the lead it contains; or oily substances standing long on it may produce the same effect, stain it, or render it dull.

To determine its power of resisting friction, it may be rubbed with sand; and if this scratch it more readily than it does a glaze known to be good, we may be assured it is soft.

If vinegar be boiled for some hours in a vessel coated with a soft glaze, it will attack the glaze, and dissolve a portion of its lead, which will be precipitated from the vinegar on the addition of a few drops of sulphuric acid, commonly called oil of vitriol.

But a method more within every one's reach, and therefore deserving to be known, is, to let fall a drop of strong ink on a piece of earthen-ware, dry it before the fire, and then wash it. If the glaze be too soft, the ink will leave a slight spot.

Some earthen ware can sustain a sudden application of heat, and cold, sufficiently well for the uses of the kitchen, and are therefore called fire-ware. Great improvements have recently been made in this particular sort of ware, as it will really now do, what it was long professed to do, without sufficient authority, viz. bear a repetition of contact with a fierce fire without injury. The great secret is not to place it on anything extremely cold when it is taken off the fire, but suffer it to cool gradually.

So far we have confined our observations to the materials used in the manufacture of pottery, and to the process of glazing; it may now be proper to speak of the implements employed in that important branch of British manufactures.

The wheel, and lathe, are the chief and almost the only instruments in pottery: the first for large works, and the last for small. The potter's wheel consists principally in the nut, which is a beam or axis, whose foot or pivot plays perpendicularly on a freestone sole or bottom. From the four corners of this beam, which does not exceed two feet in height, arise four iron bars, called the spokes of the wheel; which forming diagonal lines with the beam, descend, and are fastened at bottom to the edges of a strong wooden circle, four feet in diameter, perfectly like the felly of a coach-wheel, except that it has neither axis nor radii, and is only joined

to the beam, which serves it as an axis by the iron bars. The top of the nut is flat, of a circular figure, and a foot in a diameter; and on this is laid the clay which is to be turned and fashioned. The wheel thus disposed is encompassed with four sides of four different pieces of wood fastened on a wooden frame; the hind-piece, which is that on which the workman sits, is made a little inclining towards the wheel; on the fore-piece is placed the prepared earth; on the side-pieces he rests his feet, and these are made inclining to give him more, or less, room. Having prepared the earth, the potter lays a round piece of it on the circular head of the nut, and sitting down, turns the wheel with his feet till it has got the proper velocity; then, wetting his hands with water, he presses his fist, or his fingers' ends, into the middle of the lump, and thus forms the cavity of the vessel, continuing to widen it from the middle; and thus turning the inside into form with one hand, while he proportions the outside with the other, the wheel constantly turning all the while, and he wetting his hands from time to time. When the vessel is too thick, he uses a flat piece of iron, somewhat sharp on the edge, to pare off what is redundant; and when it is finished, it is taken off from the circular head by a wire passed under the vessel.

The potter's lathe is also a kind of wheel, but more simple and slight than the former: its three chief members are an iron beam or axis three feet and a half high, and two feet and a half in diameter, placed horizontally at the top of the beam, and serving to form the vessel upon; and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, fastened to the same beam at the bottom, and parallel to the horizon. The beam or axis turns by a pivot at the bottom in an iron stand. The workman gives the motion to the lathe with his feet, by pushing the great wheel alternately with each foot, still giving it a greater, or less, degree of motion, as his work requires. They work with the lathe with the same instruments, and after the same manner as with the wheel. The mouldings are formed by holding a piece of wood or iron, cut in the form of the moulding to the vessel, while the wheel is turning round; but the feet and handles are made by themselves, and set on with the hand; and if there is any sculpture in the work, it is usually done in wooden moulds, and stuck on, piece by piece, on the outside of the vessel.

Staffordshire is the chief seat of the pottery manufacture, and hence vast quantities of the numerous articles which it produces, are annually disseminated throughout the British dominions, and exported to most parts of the globe.

For the foreign names of POTTERY-WARE, see EARTHEN WARE, and PORCELAIN.

POTTLE signifies, properly, an English measure, containing two quarts. Two pottles, in liquid measure, make a gallon; but, in dry measure, three go to a gallon. But the name is vulgarly and arbitrarily applied to little baskets, of indefinite size, for holding fruit, and other small vegetables, such as pease, mushrooms, &c. &c.

POULI, a copper coin of Italy, equivalent to 8-30ths of a penny sterling.

POUNCE, gum-sanderach, pounded and sifted very fine, to rub on paper, in order to prevent the ink from spreading on the surface of the paper, and to render the writing clear and distinct.

Pounce is also a little heap of charcoal dust, inclosed in a piece of muslin, or some other open stuff, to be passed over holes pricked in a work, in order to mark the lines or designs on paper, silk, &c. placed underneath: which are to be afterwards finished with a pen and ink, a needle or the like. This kind of pounce is much used by embroiderers to transfer their patterns upon stuffs; by lace-makers, and sometimes also by engravers.

POUND, a certain weight used as a standard to determine the gravity and quantity of bodies.

In England we have two different pounds; the pound *troy*, and the pound *avoirdupois*. The pound *troy* consists of twelve ounces, each ounce of twenty pennyweights, and each pennyweight of twenty-four grains. This pound is used in the weighing of silver, gold, precious stones, &c. It is also used in ascertaining the strength of liquors. Apothecaries likewise make use of this pound though they divide it differently; twenty-four grains making a scruple, three scruples a drachm, eight drachms an ounce, and twelve ounces a pound.

The pound *avoirdupois* consists of sixteen ounces; but then the *avoirdupois* ounce is less by forty-two grains than the *troy* ounce. One hundred and twelve pounds *avoirdupois* make the hundred weight, or quintal. By this weight almost all coarse and heavy goods are weighed; such as butcher's meat, grocery, cheese, butter, &c. wax, pitch, tallow, and all metals except gold, and silver.

Avoirdupois weight was first used in Henry VIIIth's reign; it was introduced expressly for weighing butcher's meat, and other coarse and heavy articles.

For an explication of the pound-weights of foreign nations, See **WEIGHTS AND MEASURES**.

POUND, also denotes a money of account containing more, or less, according to the several names added thereto, and the different countries it is used in: as in England, a pound sterling; in France, a pound or *livre* *Tournois*; in Holland and Flanders, a pound gross, and Flemish, &c. The English pound contains 20s., the shilling 12d., and the penny four farthings. The Irish currency differs from the English, as 13

to 12; thus one shilling English is one shilling and a penny Irish, and 11 English is 11. 1s. 8d. Irish currency. In America, and the West India Islands, the difference between the value of a pound sterling and the currency, varies in almost every two contiguous states.

Merchants, &c. use initial letters, *£.* or *£. Sterling*, for pounds sterling; *£. G.* for pounds gros, and *£. l.* or *£b.* for pounds *Tournois*.

POUNDAGE, is understood to comprehend the customs, and other duties, payable on all goods imported, (except those free of duty or liable to tonnage,) being in most cases levied at so much in the *pound* or *per cent.* on the respective rates or values.

POUNDAGE (in law), is the sum of 1s. in the pound, payable to the sheriff upon any writ of execution for debt, against the goods or body of the defendant.

This money was formerly payable by the plaintiff, and was never allowed in costs; but by a modern act, in every action in which the plaintiff shall be entitled to levy under an execution against the goods of any defendant, such plaintiff may also levy the poundage-fees and expenses of the execution, over and above the sum recovered by the judgment.

POWDER-BLUE, or **STARCH-BLUE**, (GER. *Blaussel*. DU. *Blaauwzel*, *Blaauw*. DA. *Blaafarve*, *Blau*, *Blausel*. SW. *Blaussell*, *Blästärkelse*. FR. *Bleu d'empois*. IT. *Turchino d'amido*. SP. *Polvos azules*. PORT. *Azul*, *Azul de esmalte*. RUS. *Skorbilo*. POL. *Lazar*.) is a composition of starch, some bluish pigment, wax, and occasionally a little alum. The whole of these substances are boiled together, and when dry the composition is reduced to an impalpable powder. The use of this article is to stiffen linen, and give it, at the same time, that azure cast which makes it appear of a softened white hue.

POWDER, *Gun*. See **GUN-POWDER**.

POWDER, *Hair*. See **HAIR-POWDER**.

POWDER-CHESTS, wooden triangular chests, filled with gun-powder, pebble-stones, and such like materials, set on fire when a ship is boarded by an enemy.

POWDER-HORN, a horn case, mounted with silver, brass, or plated ware, in which powder is kept. Powder-horns are used by the light companies of the British army, slung over the shoulder by a cord-belt, Great quantities of powder-horns are manufactured at Birmingham.

POWDER-MILL is generally used to express the whole of the premises whereon gun-powder is manufactured. The principal powder-mills in England are those of Hounslow, Dartford, Waltham-Abbey, &c. See **GUN-POWDER**.

POWDER-SUGAR, (GER. *Pulver*

zucker. Du. *Poetsersuiker.* DA. *Pudder-sukker.* Sw. *Pudersocker.* FR. *Sucre en pudre.* IT. *Zucchero nero o rottame.* POL. *Cukier maczka*.) loaf-sugar pulverised. See SUGAR.

POWER, in law, is an authority which one man gives to another to act for him; and it is sometimes a reservation, which a person makes in a conveyance, for himself to do some acts, as to make leases or the like.

Thus POWER OF ATTORNEY is an instrument or deed whereby a person is authorised to act for another, either generally, or in a specific transaction. For the form of this instrument, see LETTER OF ATTORNEY.

POZZOLANA, or PUZZULANA, a reddish kind of earth used in Italy for sand. It takes its name from Pozzoli, in the kingdom of Naples. This mixed with lime, makes the best mortar in the world; for it petrifies in water, penetrates black flints, &c. The best pozzolana is found about Pozzoli, or Puteoli, and Baiæ, and Bumæ, in Naples. See further STUCCO.

PRACTICE, in arithmetic, has its name from its general use in business, as it is a rule that teaches the best and most compendious methods of solving almost every question that occurs in mercantile transactions, and is to be preferred to compound multiplication, and to the Rule of Three, whenever the first term is unity. Practice may be defined, a method of finding the value of any quantity of goods, from the price of an integer being given. This method is of Italian origin, and is fully exemplified in most books of arithmetic.

PRECIOUS STONES. (GER. *Edelsteine.* Du. *Edele steenen.* DA. *Edelstene.* Sw. *Adle stenar.* FR. *Pierres précieuses.* IT. *Pietre preziose.* Sp. *Piedras preciosas.* PORT. *Pedras preciosas.* Rus. *Dorogia Kamenja.* POL. *Drogié Kamienie.* LAT. *Lapides pretiosi, Gemmæ.*) This appellation is bestowed upon the gems dug from mines, and found either in masses, or small detached pieces, in various parts of the world. Asia, and South America, are the parts of the world supposed to be most abundant in precious stones. For accounts of the different species of precious stones, known in commerce, as the diamond, ruby, emerald, &c. See each under its proper head. See also AFRICA, AMERICA, and EUROPE.

PREMIUM denotes that sum of money, or per centage, which is given to an underwriter for insuring the safety of a ship, or merchandize. The premium is always expressed to have been received at the time of underwriting; "we the assurers, confessing ourselves paid the consideration, due unto us for this assurance by the assured." This being subscribed by the underwriter, it is proper to inquire, whether, if the premium were not actually paid at the time, he could

afterwards maintain an action for it against the assured, who might then produce his subscription as evidence against himself. Questions upon policies of insurance stand most broadly upon the usage of the place where the policy is effected, and this question would, no doubt, be determined by usage. By the custom of London, the underwriter credits the broker, and not the assured, for the premium; and, therefore, the underwriter cannot demand it of the assured; but the broker as certainly can. *Airey and others, assignees of Milton v. Bland.* Sittings at Guildhall, 14 Geo. 3.

But though generally true, that an underwriter, having subscribed a policy, and thereby confessed the receipt of the premium, is estopped from claiming the premium; yet when by the fraud of the assured the underwriter is induced to give the credit to the broker for the premium, and the broker to give credit to the assured, in that case the underwriter is entitled to receive the premium from the assured. *Foy v. Bell.* 3 Taunt. 495.

An underwriter, after executing a policy, and giving credit to the broker for the premium, may recover the premium, if it appear that the assured (to cover a balance due from the broker to himself) procured him to effect the insurance, debiting the assured in account with the premiums, and lodging the policies in the hands of the assured, to enable him to receive the losses. *Mavor v. Simeon,* 3 Taunt. 487.

Where credit was given by insurance-brokers, in an account delivered in by them to an underwriter, for the premiums of re-assurances, declared illegal, by 19 Geo. 2. c. 37.; after which the assured gave notice to the brokers, not to pay the money over to the underwriter and indemnified them for withholding it (*Edgar and another v. Fowler.* 3 East, 222.) held, that the underwriter could not maintain an action against the brokers, to recover such premiums as for money had and received by them to his use; the transaction being illegal, and the money not having actually been paid, but only credit given for it in account.

A broker effecting a policy, being the common agent of the assured and the underwriter, while the premium remains in his hands for the one party, and the policy for the other, and having received notice of events which entitled the assured to a return of premium before action brought by underwriter to recover the full premium, is authorised to deduct such return, and only to pay over the difference to the underwriter. *Shee v. Clarkson,* 12 E. R. 507.

The premium or consideration paid, given, or contracted for, must, like the risk, be inserted in the policy. 35 Geo. 3. c. 63. sect. 11.

The premium is always proportioned to the risk.

PRESS in the mechanic arts, a machine made of iron or wood, serving to squeeze or compress any body very closely. The ordinary presses consist of six members, or pieces, viz. two flat smooth planks, between which the things to be pressed are laid; two screws or worms, fastened to the lower plank, and passing through two holes in the upper; and two nuts in form of an S, serving to drive the upper plank, which is moveable, against the lower, which is stable, and without motion.

PRESS used by *inlayers*, resembles the joiner's press, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a tressel, being sustained by two legs or pillars, jointed into it at each end. This press serves them for sawing and cleaving the pieces of wood required in marquetry or in-laid work.

PRESS, *funder's*, is a strong square frame, consisting of four pieces of wood firmly joined together with tenons, &c. This press is of various sizes, according to the sizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; so that, by driving wooden wedges between the mould and the sides of presses, the two parts of the mould wherein the metal is to be run may be pressed close together.

PRESS, *Printing*. See **PRINTING**.

PRESS, *Rolling*, is a machine used for the taking off prints from copper-plates. It is much less complete than that of the letter-printers. See its description and use under the article *Rolling-press*, **PRINTING**.

PRESS, in *coining*, is one of the machines used in striking of money, differing from the balance in that it has only one iron bar to give it motion, and press the moulds or coins: it is not charged with lead at its extremes, nor drawn by cordage. See **COINAGE**.

PRESS, *Binder's cutting*, is a machine used equally by book-binders, stationers, and pasteboard-makers; consisting of two large pieces of wood, in form of cheeks, connected by two strong wooden screws, which, being turned by an iron bar, draw together, or set asunder the cheeks, as much, as is necessary for the putting in the books, or paper, to be cut.

PRESS, in the *woollen manufactory*, is a large wooden machine, serving to press cloths, serges, râteaux, &c. thereby to render them smooth and even, and to give them a gloss. This machine consists of several members; the principal whereof are the cheeks, the nut, and the worm or screw, accompanied with its bar, which serves to turn it round, and make it descend perpendicularly on the middle of a thick wooden plank, under which the stuffs to be pressed are placed. The calender is also a kind of press, serving to press or calender linens, silks, &c.

PRESS, used by *joiners*, to keep close the pieces they have glued, especially panels, &c. of wainscot, is very simple, consisting of four members, viz. two screws, and two pieces of wood, four or five inches square, and two or three feet long; whereof the holes at the two ends serve for nuts to the screws.

PRESSES, used for expressing of liquors, are of various kinds; some in most respects the same with the common presses, excepting that the under plank is perforated with a great number of holes, or has a channel cut in it, to let the juice expressed run into a tub or receiver underneath; others have only a screw or arbor passing through the middle of the moveable plank, which descends into a kind of square box, full of holes, through which the juices flow as the arbor is turned.

PRESSING, in the *manufactures*, is the violently squeezing a cloth, stuff, &c. to render it smooth and glossy. There are two methods of pressing, viz. cold or hot. As to the former, or cold-pressing, after the stuff has been scoured, fulled, and shorn, it is folded square in equal plaits, and a skin of vellum, or pasteboard, put between each plait. Over the whole is laid a square wooden plank, and so put into the press, which is screwed down tight by means of a lever. After it has lain a sufficient time in the press, they take it out, removing the pasteboards. Some only lay the stuff on a firm table, after plaiting and paste-boarding, cover the whole with a wooden plank, and load it with a proper weight.

The method of pressing hot is this: when the stuff has received the above preparations, it is sprinkled a little with water, sometimes gum-water, then plaited equally, and between each two plaits are put leaves of pasteboard; and between every sixth or seventh plait, as well as over the whole, an iron or brass plate well heated in a kind of furnace. This done, it is laid upon the press, and forcibly screwed down. Under this press are laid five, six, &c. pieces at the same time, all furnished with their pasteboards and iron plates. When the plates are cold, the stuffs are taken out and stitched a little together to keep them in the plaits. This manner of pressing was only invented to cover the defects of the stuffs; and accordingly it has been frequently prohibited.

PRESSMAN, he whose business it is to make the impression of print by the press: distinct from the compositor, who ranges the types. See **PRINTING**.

PRICE-CURRENT, a list of enumeration of various articles of merchandise, with their prices, the customs and excise payable thereon, and the drawbacks allowed upon particular sorts of goods. Lists of this description are published periodically, generally once or twice a week, in most of the great commercial cities and towns of Europe.

PRICKING, in the sea language, is to make a point on the plan or chart, nearly about where the ship then is, or is to be at such time, in order to find the course proper to be steered.

PRIMAGE, is a certain allowance paid by the shipper or consignee of goods, to the mariners and master of a vessel for loading the same. It is mentioned in stat. Hen. 8. c. 14. In some places it is a penny in the pound; in others sixpence for every pack or bale, or otherwise, according to the custom of the place.

PRINCIPAL, the capital sum due, or lent, in opposition to interest.

PRINCIPAL, also denotes the first fund put by partners into a common stock, by which it is distinguished from the calls or accessions afterwards required.

PRINCE'S METAL, (GER. *Prinzmetall*. DU. *Prinsmetaal*. DA. *Printsmetall*. SW. *Prinsmetall*. FR. *Metal de Prince*. IT. *Metallo del Principe*. SP. *Metal de principe*. PORT. *Metal do principe*. POL. *Przynemetal*. LAT. *Metalum principis Rupertii*.) a fine kind of brass, or alloy of copper and zinc, in imitation of gold. See **PINCHBECK**.

PRINTING, the art of taking impressions from characters or figures, moveable, or immoveable, on paper, linen, silk, &c. There are three kinds of printing, the one from moveable letters; another from copperplates; and the last from blocks. The first called press-printing, the second rolling press-printing, and the last calico, &c. printing.

For the information acquired on the two last-mentioned kinds of printing, we refer the reader to *titles* **ENGRAVINGS**, **COPYRIGHT**, and **CALICO**.

Press printing resolves itself into only two heads of consideration; viz. with moveable, and with immoveable letters. The latter mode is denominated *stereotype*, and will be found under that designation. To the consideration of common press-printing, we propose to confine this article, and even under that restriction it will be necessarily tedious, though we shall pass over the controverted questions respecting the origin and date of this art, at least, according to its modern application, and other matters, beyond the immediate purpose of a mere dictionary; only briefly observing, that, like many other European arts, it is probably *derived* from the Chinese.

Books were, it should seem, always made of their present shape, an oblong square, from the first invention of printing, according to the *modern mode*, about the middle of the 15th century, the earliest known having been invariably of the folio size. The previous manuscripts were (according to the different purposes, public or private, to which they were applied,) attached to each other longitudinally to make a roll, or lati-

tudinally to make something more resembling what we call a *book*. Like every other art, as it advanced in facility of exercise, it improved in convenience, and ornament. Books of different dimensions soon succeeded, the exclusively heavy folios of early introduction. Since that era it has been usual, as it has been convenient, of latter years to print the larger books, as folio and quarto, on a large type, whilst the smaller, in *duodecimo*, *octodecimo*, &c. are executed with more diminutive types,—a distinction the ancients did not so much attend to, as they ought. Of these types, the larger have acquired the unmeaning names of cannon, primer, pica, &c. and the very large double sizes of these; while, for the smaller, we have bourgeois, nonpareil, diamond, &c. Roman and italics, of either size, with the *diminutive* of several, as *small pica*, *long primer*, &c. together with the more significative *long*, *broad-faced*, *lean-faced*, *long-bodied*, &c. as the case may be.

The workmen employed in the art of using these types, of which we have just been giving an account, are divided into two departments, compositors, and pressmen. The former arrange and dispose the letters, so as to compose the matter of the page; the latter apply the ink, and take off the impression. The letters are placed in cases, having different divisions, as many in number as there are letters of different sizes, significations, and kinds, with the marks of punctuation, and other such things to be expressed. The compositor holds an instrument usually made of iron, denominated the *composing stick*, in one hand, while with the other he takes the letters, &c. out of the compartments as he wants them, and disposes them in range on a slip of brass, called a *rule*, in his composing stick, and putting a blank piece between every two words, as also, wherever they are proper, all the other points and marks with which his frame or box supplies him, he forms one line after another, till the stick being full, he empties it out upon another instrument, called a *galley*; several of which ranged and wedged tight in a frame, called a *chase*, are ready for the press. It is sufficiently obvious, that this succinct description can give but an inadequate notion of the process of composing, but it is all our limits will allow, and may be sufficient for a general understanding of the art. To fit the paper to receive the impression of the combination of words, for a page so disposed, as we have described, it must be not only well, but equally, moistened. In order to produce the latter effect, a large quantity of it is always laid, sheet over sheet, in a heap, and well pressed down.

The application of the ink to the form, in which the letters for the page are placed, is by two balls, which are a kind of wooden cups with handles, the cavities whereof are filled with wool, or other such matter, and covered with sheep-skin, making a sort of

cushion. One of these the pressman takes in each hand, and applying them on the ink-block, to charge them with ink, he works them one against the other, to mix, and distribute, the ink equally; and, at length, smears over the form, by beating, and daubing them several times over the whole surface thereof. This leaves the form in a condition to be passed under the press, with the moistened paper laid thereon. See further, the four following articles.

PRINTING - INK. (GER. *Drucker-schwärze*. DU. *Drukinkt*, *Drukzwart*. DA. *Bogtrykkerfarve*. SW. *Trykkefarve*. - FR. *Encre à imprimer*. IT. *Inchiostro da stampa*. SP. *Pobos de imprenta*. PORT. *Bres, ò tinta para imprimir*. POL. *Czerni lo drukarskie*.) a preparation of linseed oil, reduced by boiling to a proper consistence and tenacity, (to increase which qualities, turpentine is added if necessary,) and lamp-black, in order to make black ink. For red ink, vermilion is substituted, in lieu of lamp-black.

PRINTING-PAPER, (GER. *Druckpapier*. DU. *Drukpapier*. DA. *Trykpapir*. SW. *Trykpapper*. FR. *Papier à imprimer*. IT. *Carta da stampa*. SP. and PORT. *Papel para imprimir*. RUS. *Kaischnaja bumaga*. POL. *Drukarski papir*.) a general name given to white paper, of whatever quality, used for the purposes of printing. See PAPER.

PRINTING-PRESS is a complicated machine, consisting of so many parts, as to render any examination of its composition, or indeed any thing more than a very general description of its structure, impracticable here. Its two principal parts, each whereof consists of several subordinate ones, are, 1st, the *body* of the press, which serves to give the stroke for the impression; and 2dly, the *carriage*, on which the *form* is laid to receive such impression. The body consists of two thick planks, or cheeks of wood, placed perpendicularly, at such a distance from each other, as to admit of the carriage, with all its apparatus, between them. These are held together, with this requisite intervening space, by a transverse immovable plank at the top, called the *cap*. Under this, at its determined distance, is another transverse plank *moveable*, sustained by, or as it were, hung from, the cap by two long iron bolts or pins. At another determined distance, below this, is a third transverse plank, called the *shelves*, which is immovable. Below this, at its proper interval, is a fourth transverse plank, called the *winter*, which is moveable. This bears the carriage, and sustains the effort of the press beneath, as the *head* does above; each being, as has been observed, moveable, and each giving way sufficiently for the operations of the machine, by making room for what is to be inserted on the plane of the carriage, and for the subsequent momentum to be produced by the manual operation of the pressman.

The carriage, which, it has been observed,

makes the 2d principal member of the press, rests on that transverse plank, which is denominated the *winter*, and on a prop called the *fore-stay*. On this carriage rests the plank, which, by other provisions of the machine, the pressman is enabled to turn in or out. On this plank is a square wooden frame, called a *coffin*, wherein is inclosed a marble, or other polished stone, for the reception of the *form*; which being placed thereon in its proper situation, and with all the accompanying preparations to obtain accuracy, (too numerous and minute to be mentioned,) the pressman, by means of a handle, called a *rounce*, forces down a superincumbent square piece of wood, denominated the *platten*, upon the form, and thereby impresses, on the sheet of paper beneath it, the letters or devices intended to be, what is called, *printed*. From this process, superficially as we have been obliged to describe it, the reader will have perceived, that only one side of a sheet of paper can be printed by one such effort; wherefore, each sheet, having received such impression, is taken out, and remanded to the press, for the other side to receive a similar one, if such be the object for which it has been put into the printer's hands. It requires neither sagacity, nor reflection, to discover, that this double operation is adverse to expedition, as well as to the economizing of labour; of which more hereafter.

Various patents have been obtained of late years for inventions, to facilitate the operation of printing. Most, if not all, of them have had principally in view the substitution of mechanical powers for manual operations; not indeed, however, to the exclusion of other subordinate improvements. Among the more prominent features of these several projects, have been the substitution of a cylinder and a plane, or of two cylinders, to produce a pressure equivalent to that of the two plain surfaces, according to the old-established method, by a process more powerful, more economical, and more expeditious. Secondly, by the use of rollers for supplying the ink, or colouring liquid, to the surface of the form of types, in lieu of the common method by balls, and manual application. For these improvements upon the former system of printing, a patent was obtained so long ago as 1790, by a Mr. Nicholson. The practical operation of the machinery, however, did not prove equal to the expectations formed from the theory, as illustrated by the specification; and, though the honour remained due to Mr. Nicholson of having suggested the *principles*, on which the great object of substituting machinery for manual labour, viz. economy, was to be accomplished, his invention has been superseded by various other devices, more approaching to perfection in design, and practicability in operation. At length, a patent has been obtained by Mr. Cowper, of Nelson-square, for sundry improvements, which bid fair for

having brought the art of printing to a state of comparative perfection. Within the remaining compass which can be dedicated to this article, all that can be offered by way of recommendation, (for description of so complicated a piece of machinery is out of all question,) is, that by the engine, which is the subject of the patent under consideration, worked by steam, or other competent power, both sides of a sheet of paper are printed at once, in consequence of the immediate conveyance of it from one printing cylinder to another, with such rapidity, that it is estimated eight hundred sheets per hour may be completely printed on both sides, with the assistance of only one man and two boys. One of the distinguishing perfections of this machine is, the precisely equal distribution of the ink upon the face of the types, by a process comparatively simple, and without the aid of direct manual labour.

Before we conclude this article, it is necessary to advert to stat. 39 Geo. 3. c. 79; by which the proprietors of printing presses are laid under severe restrictions with respect to possession, and use, of such; and that letter-founders, type-sellers, and press-makers, are subjected to heavy penalties for exercising their respective trades, without having first obtained certificates respectively from the clerks of the peace of the county, district, or place, where they exercise their callings.

PRINTSELLER. The printseller is very often an engraver. He deals in prints and maps; the latter, however, is a more profitable article than the former, as maps seldom vary much in their purchase. Of late years, this business has experienced an astonishing improvement in Great Britain, and vast quantities of our prints, and maps, have been exported to the continent of Europe, whence, not long ago, we were in the habit of procuring almost every article of this description. This fortunate change is principally attributable to the patriotic efforts of Messrs. Boydell, who, with a zeal highly commendable, have, by holding forth suitable encouragement to native artists, dispelled the lethargy which so long held captive the talents of English engravers, and raised their performances to a pinnacle from whence we trust they will never be deposed.

PRISAGE, is that custom or share that belongs to the king, out of such merchandise as are taken at sea, by way of lawful prize. 13 Eliz. c. 5. See **PRIZE**.

PRISAGE OF WINES, mentioned in 1 Hen. 8. c. 5. is a term almost out of use;

being now called *bullcrag*, because the king's chief butler receives it. It is a custom, whereby the prince challenges out of every bark laden with wine, containing less than forty tons, two tons of wine; the one before, the other behind, the mast, at his own price, which is twenty shillings a ton; yet this varies according to the custom of the place.

PRIVATEERS are generally considered private ships of war, fitted out by individuals, in order to annoy and plunder the enemy. The commission of a captain of a privateer is only temporary, he being liable to be turned out at the pleasure of the owner, who, in his turn, can only retain his privilege of privateering, so long as it is the will of the prince to permit him to carry on that species of predatory warfare. Though such appointments are useful in war, by harassing the enemy, yet may the system be esteemed but one remove from piracy; for seldom, if ever, are the fitters out of privateers actuated by a wish to promote the public welfare, or to benefit the national cause; self-interest being the main-spring of their proceedings. However, so long as this species of warfare is practised by the nations of Europe, it will be necessary for commercial men to understand at least the general regulations under which it is permitted; the particular ones, depending on the private and individual compacts of states, are not within our province.

The owners of privateers have a commission which empowers them to appropriate to their own use whatever prize they make, after legal condemnation; and government allows them, besides, further encouragement; but, in case we are at war with more potentates than one, they must have commissions for acting against each of them; otherwise, if a captain, carrying only one against the Spaniards, should in his course meet with, and take, a Frenchman, this prize is not good, but would be taken from him by any man of war he met, and could not be condemned (*for him*) in the admiralty.

The manner of fitting out these privateers has commonly been at the joint expense of several merchants.

In some of these adventures, the men who are on board go on the terms of no prize no pay: and, in this case, the produce of whatsoever is taken goes half to the ship, (for the owners,) and half to the men, divided among them according to the articles of agreement; but, when the men sail for wages, the captures appertain entirely to the owners, except a small part, which is commonly stipulated to be given the sailors, extra of their wages, in order to animate them in their behaviour; and both ways of arming are regulated by the articles entered into between the owners and mariners, of which a copy is added at the end of this article.

No privateers may attempt any thing

against the law of nations, as to assault an enemy in a port or haven under the protection of any prince or republic, be he friend, ally, or neutral; for the peace of such place must be kept inviolable. — *Molloy de Jur. Mar. p. 42. sec. 7.*

And, at the time of granting these private commissions, great care is always taken (by bond) to preserve the leagues, with our allies, neutrals, and friends, according to the various and several treaties subsisting between us, and it is for this reason that security is demanded, and given by responsible men (not concerned in the ship) that they will give full satisfaction for any damage or injury that they shall commit in their courses at sea, contrary to, and in breach of treaties, and also under the penalties of forfeiting their commissions, and for which their ships are likewise made liable.

If any privateer wilfully commit any spoil, depredation, or any other injuries, either on the ships of friends or neutrals, or on the ship or goods of their fellow-subjects, they will be punished, in proportion to the crime, either with death, or otherwise; and the vessels are subject to forfeiture.

Whether a ship taken be lawful prize, or not, shall be tried in the admiralty.

If two ships with letters of marque accidentally meet with a prize at sea, though only one attack and take her, yet the other, being in sight, shall have an equal share of the prize, though he afforded no assistance in the capture; because his presence however struck a terror in the enemy, and made him yield; which perhaps he would not have done, had his conqueror been single, so that all ships that are in sight, though they cannot come up to assist in the engagement, are entitled by the *common law* to a distribution of the spoil. — *Leonard, 2. p. 182. 1 H. Black. 265. 4. E. Rep. 258. 13 E. Rep. 574.*

But, if those to whom letters of marque are granted should, instead of taking the ship and goods appertaining to that nation, against which the said letters are awarded, wilfully take or spoil the goods of another nation in amity, this would amount to a downright piracy, and the persons so offending would, for such fault, forfeit their vessel, (and the penalties in which their securities are, according to custom, bound, on taking out such letter,) notwithstanding their commission; but this must be understood, where such a capture is done in a piratical manner; for, if it is made upon a strong presumption, supported by many circumstances and appearances that a captain is just, as belonging to him against whom the reprisals are granted, though, upon examination, it proves otherwise, and the suffering parties have their ship and goods restored, yet the captors are not liable to punishment, though sometimes they may be to damages. On the contrary, they are

justified in endeavouring to recover their right, or distress the enemy, (for which the letters were granted them,) though in effecting it they may be deceived, as it is natural for the enemy to cover their effects in the best manner they can. It would be impossible always to determine the affair at sea, therefore it is allowable to bring a dubious capture into port, in order to more nice and just scrutiny and inspection; otherwise the goods of an enemy would often escape. However, to guard against unlawful seizures, the government have wisely directed sufficient caution to be given (as before-mentioned) for the due observance of the letters according to law, before they permit their issuing; and, when there is a breach committed, the penalties are inflicted. — *Roll's Ab. 530. — Moor, 776.*

The following are such articles of agreement as have been commonly entered into between the captains of privateers, and their crews.

Articles agreed between captain A. B., commander of the private man of war, called the Terrible, (with 20 guns mounted, carrying nine-pound shot, twenty brass patereroes, four mortars, and some wall-pieces,) manned with two hundred men, now lying in Church-hole, (designed to cruise against the French and Spaniards,) on the one part, and the said ship's company on the other, witnesseth,

1. That the said captain A. B., for himself, and in behalf of the owners of the said ship Terrible, shall put on board her great guns, swivels, powder, shot, and all other warlike ammunition necessary for them; as also small arms, and provisions sufficient for the said ship's company for a six months' cruise at sea, from their sailing from the Downs; in consideration of which, the owners or their assigns shall be reimbursed out of the first prize or prizes taken by the said ship Terrible, before any dividend is made thereof; the whole charge of warlike stores (great guns and small arms excepted,) victualling, advance-money, and the expenses the owners are at for surgeon's chest, and a set of music; after which, one half of the net proceeds of such prize or prizes, as shall be taken, to be for the account of the owners, and at the disposition of the managers; and the other half of such net proceeds to be the net property of the ship's company; the captain's share of which to be 6 (in some 8) per cent. and the residue to be divided in the proportions mentioned in the eleventh article of these presents.

2. That, for preserving decorum on board the said private man of war, no man is to quit, or go out of her, on board of any other vessel or vessels, or on shore, without leave obtained of the commanding officer on board, under the penalty of such punishment as shall be esteemed proper by the captain and officers.

3. That it shall be entirely in the captain's power to cruise where he shall esteem most beneficial to the interest of the owners and ship's company.

(In some, it is to cruise where the managers, and in others, where the owners shall direct.)

4. That, if any person be found a ringleader of mutiny, or causing a disturbance on board, refuse to obey the command of the captain and officers, behave with cowardice, or get drunk in time of action, he or they shall forfeit their share, to be divided amongst the ship's company, and be otherwise punished according to law.

5. That all clothes, bedding, watches, and rings in wear, buttons, buckles, and what else is deemed small plunder by custom, is to be divided amongst the ship's company, according to their several stations, the captain not to interfere with them; the cabin-utensils in present use for the commander.

6. That if any person shall steal, or convert to his use, any part of the prize or prizes, or be found pilfering any money or goods, and be convicted thereof, he shall forfeit his share to the ship and company.

7. The captain has the power of taking out of any prize or prizes, whatever stores he may judge necessary for the ship *Terrible*, without paying for them; provided the prize is not disabled thereby.

8. That whosoever first spies a sail, which proves to be a prize, shall have seven pounds, (in some only one guinea, in others five,) and the first man proved to board a prize before she strikes, shall have a gratuity of ten pounds (in some ten, and in others fifteen guineas) for his bravery, to be deducted out of the gross sum of the prize.

9. That if any private man shall lose a leg, arm, or eyes, in the time of action, or in the ship's service, he shall, besides the advantage of *Greenwich Hospital*, have a gratuity of 25*l.*, and in proportion to the officers, exclusive of shares; (in others only 20*l.* to a private man, 50*l.* to the captain 40*l.* to the first lieutenant, and 30*l.* to each of the other lieutenants, master, and surgeon;) the said sum to be deducted out of the gross sum of the prize; and, in case of mortality under cure, the said gratuity and shares to be made good to their assigns.

10. That, for the farther encouragement of the said private man-of-war's company, it is agreed that, the chief officers shall have six guineas, the petty officers and able seamen five guineas, able-bodied landmen three guineas, and boys one guinea, advanced to them in the *Hope* (in some, the officers and seamen have only five guineas, and the landmen two.)

11. That the half of the net proceeds of all prizes taken by the ship *Terrible*, which is appropriated to the ship's company, be divided amongst them in the manner following, after the captain's 6 or 8 per cent. (as

shall be agreed) is taken thereout as above:

When the captain has not the above-mentioned 6 or 8 per cent., but divides with the ship's company, he commonly has twelve shares as follows, viz.:—

	Shares.
The captain	12
The first lieutenant	5½ to 6
The second lieutenant	4½ to 6
The third lieutenant	3½ to 5
The master	3½ to 5
The first mate	3 to 4
The second mate	2 to 3
The surgeon	3½ to 4
The surgeon's mate	2½ to 3
The lieutenants of marines	3 to 4
The gunner	3
The gunner's mates, to each	2
The carpenter	3
The carpenter's mates, to each	2
The boatswain	3
The boatswain's mates, to each	2
The purser	3
The cooper	1½ to 2
The music, to each of them	2
The caulker	2
The master-at-arms	1½ to 2
The armourer	1½
The midshipmen, to each	1½ to 3
The quarter-masters, to each	1½
The quarter-gunners, to each	1¼ to 2
The corporals, to each	1¼ to 1½
The sail-maker	1½
The yeoman of the powder-room	2
The ship's stewards	2
The captain's steward	1½
The master of languages	1½
The captain's clerk	2
The ship's cook	1½ to 2
The captain's ditto	1½
The able seamen, to each	1½ to 2
The able landmen, to each	¾ to 1
The sea-boys, to each	½ to ¾
The land-boys, to each	¼ to ½

12. That on the death of the captain, the command do devolve on the next officer, and so on in rotation; and for the encouragement of the able seamen and others, on the loss of officers, they are to be replaced out of the ship's company, according to their gallant behaviour, as the captain shall appoint.

13. That whosoever deserts the said ship *Terrible*, within the time herein-under-mentioned, shall forfeit his prize-money to the owners and company, to enable them to procure others in his room.

14. All and every one on board does covenant and agree, to serve on board the said ship *Terrible*, the term of six months, beginning at the said ship's departure from the Downs.

15. And, lastly, for the true performance of all and every the afore-mentioned covenants and agreements, and each and every

the said parties do bind themselves, their heirs, executors, and administrators, in the penal sum of five hundred pounds, lawful money of Great Britain, firmly by these presents. In witness whereof, the said parties to these presents have hereunto severally set their hands and seals, the day of _____ in the year of our Lord, _____ and the _____ year of our sovereign lord, King George the Third. See PRIZE.

PRIVET, **PRIMP**, or **PRINT**, an indigenous shrub growing commonly in most parts of the kingdom, but especially on rocks in the most exposed situations, towards the western sea, and flowering in the months of June and July: the juice of the berries, when mixed with a solution of any acid salt, affords a black; with Glauber's salt and spirit of sal ammoniac, red; with urine, a purpleish; and with green sulfat of iron, a green, colour. On steeping these berries in a solution of salt of tartar, they yield a fine blue juice, the shade of which may be made still brighter by adding quick-lime. It is conjectured that these berries have great medicinal virtues, and that some celebrated specifics are made from their juice, especially the *eau medicinale*.

This fruit, with the addition of alum, is said to impart to wool, and silk, a good and durable green colour; but for this purpose the berries should be gathered as soon as they are ripe. The purple colour upon cards is also prepared from their juice. The kernels contained in these berries produce by expression an excellent oil. The wood serves both as fuel, and for the smaller objects of turnery, but especially for pegs, as it is uncommonly firm.

The branches of this shrub are useful for wicker-work, as well as for the finer kinds of basket, on account of their great flexibility.

PRIZE, in maritime affairs, a vessel taken at sea from the enemies of a state, or from pirates; and that either by a ship of war, a privateer, &c. having a commission for that purpose. Vessels are looked on as prizes if they fight under any other standard than that of the state from which they have their commission: if they have no charter-party, invoice, or bill of lading on board: if loaded with effects belonging to the king's enemies, or with contraband goods, those of the king's subjects recovered from the enemy, after remaining four-and-twenty hours in their hands, are deemed lawful prizes.

Although the subject of prizes has lost much of its immediate interest by the return of peace; and although the following abstracts of statutes, and regulations, relative to the whole system of prize-capture and prisage, are by the authority of laws which expired with the war, for the particular occurrences of which, they were enacted to

provide; yet much general information on the subject may be collected from them, and from some few determinations of the courts, which arose out of their application.

Regulations relative to Captures by Sea and Land, both by His Majesty's Ships and Private Vessels of War, during Hostilities; being the Substance of an Act for the Encouragement of Seamen, and for the better and more effectually manning His Majesty's Navy during the present War (1805). 45 Geo. 3. c. 72.

1. The act of 43 Geo. 3. c. 60., is hereby repealed, except as to proceedings under the same, already commenced.

2. *To whom prizes belong.*—The flag and other officers, seamen mariners, and soldiers, on board every vessel of war in his majesty's pay, shall have the sole interest and property of and in all and every ship, vessel, goods, and merchandise, which they have taken, or shall hereafter take during the continuance of hostilities against France, the Batavian republic, the Italian and Ligurian republics, and the kingdom of Spain, since the respective dates when reprisals were granted against the said powers; after the same shall have been adjudged a lawful prize, to be divided in such proportions, and after such manner as his majesty hath, by his proclamation, already ordered and directed, or as his majesty shall think fit to order and direct, by proclamation.

3. *To whom belong prizes, that have been defended by any ports.*—The flag and other officers, seamen, mariners, and soldiers, on board every vessel of war in his majesty's pay, being armed, officered, and employed in his majesty's service, who shall take any fortress upon the land, or any arms, ammunition, stores of war, goods, merchandise and treasure, belonging to the enemies of Great Britain, upon the land, or any ship or vessel, or merchandise, laden on board the same, in any creek, haven, or road, belonging to and defended by the said fortress upon the land, shall have the sole interest and property in the same, after final adjudication thereof as lawful prize, to be distributed in such proportions and manner, as is before mentioned. In all conjunct expeditions of the navy and army against any such fortress upon the land, directed by instructions from his majesty, the flag and general officers and commanders, and other officers, seamen, mariners, and soldiers, acting in such conjunct expedition, shall have such proportionable interest and property in the capture, as his majesty, under his sign-manual, shall think fit to direct.

Where no instructions have been given.—If no such instructions shall have been given by his majesty, the respective commanders-in-chief of the fleet and of the army employed, may make agreements in writing for the division thereof, which agreements.

being approved and confirmed by his majesty, shall be binding on all persons, and the share assigned to the fleet by such agreement, shall be distributed according to his majesty's proclamation before mentioned. Both interest and property hereby given to the army, shall not extend to entitle the said army to share in the distribution of any ships or vessels, goods, merchandise, or effects, captured in the *voyage to or from such fortress*: and shares of all officers and seamen, who shall be marked *run*, and also shares not legally demanded within six years after the same shall have been paid into Greenwich hospital, shall be forfeited to the said hospital; unless (with respect to such as shall be marked *run*) such mark shall be taken off by order of the lords of the admiralty, or commissioners of the navy; and unless (with respect to the shares not claimed within the time limited) reasonable cause shall be shown to, and allowed by, the governors of the said hospital, or the judge of the court of admiralty.

5. *Bounty*.—A bounty of 5*l*. shall be granted to British ships for every man on board at the beginning of an engagement with any hostile vessel taken or destroyed; and such number shall be ascertained by the oath of three surviving chief officers or men belonging to said vessel, or of so many as survive:—within fifteen days after the administration of which oath, bills for the amount shall be directed to the treasurer of the navy. In case of total destruction, the probable number on board must be determined by the judgment of the high court of admiralty: subject, nevertheless, to appeal.

6. *Bounty-bills payable to prize-agents*.—The amount not claimed within the time limited for prize-moneys shall be forfeited to Greenwich hospital; as also the shares of such men as shall run from his majesty's service.

7. *Salvage for his majesty's vessels*.—If any vessel, formerly belonging to his majesty's subjects, shall be retaken by the enemy, it shall be restored to the former proprietors on their paying a salvage of one-eighth of her value, if the re-captors be king's ships, or one-sixth, if privateers:—provided that the enemy have not yet fitted her out for a ship of war.

8. *Bounty-money and salvage*.—All regulations concerning prizes shall apply to cases of bounty-money and salvage.

9. *Letters of marque and reprisal*.—The lords of the admiralty, or any persons empowered by them, shall, at the request of any owner whom they shall deem fitly qualified, of any ship or vessel registered pursuant to act of parliament, (such owner or owners giving security) cause to be issued in the usual manner one, or more, commissions, or letters of marque and reprisal, to any person whom such owners shall nomi-

nate to be commander, or in case of death successively commanders, of such ship or vessel, for the attacking, surprising, seizing, and taking any place or fortress upon the land, or any ship or vessel, arms, or ammunition, stores of war, goods, or merchandise, belonging to, or possessed by, any of his majesty's enemies, in any sea, creek, haven, or river; and that such ships or vessels, and that such arms, ammunition, stores, &c. with all their furniture, tackle, and apparel, so to be taken according to such commission, shall wholly belong to, and be divided among the owners of such ship or vessel, and the several persons who shall be on board the same, and be aiding and assisting in the taking thereof, in such shares and proportions as shall be agreed on with the owner or owners, their agents or factors; but such ships, &c. as may be captured by any private vessels of war belonging to the commissioners of customs or excise, shall belong to his majesty.

10. *How to proceed to obtain letters of marque*.—Every person who shall apply to the lords of the admiralty in order to obtain any commission or letter of marque, shall make such application in writing; and therein set forth a true, particular, and exact description of the ship or vessel for which such commission or letter of marque is requested, specifying her name and burthen, what sort of build she is, the number and nature of the guns on board the same, to what place belonging, the name or names of the owner or owners, and the number of men intended to be put on board the same; all which particulars shall be inserted in every commission or letter of marque to be granted in pursuance of this act; and every commander of a private vessel of war, for which a commission or letter of marque shall be granted, shall produce such commission or letter of marque to the collector, customer, or searcher, of his majesty's customs, belonging to the port whence such vessel shall be first fitted out, or to his lawful deputy; and the said collector, &c. or his deputy shall, without fee or reward, inspect and examine such ship or vessel, so as to ascertain the built and burthen thereof, the number of men, and the number and nature of the guns on board the same; and if such ship or vessel shall be found to be of such built and burthen, and be manned and armed according to the tenor of the description inserted in such commission or letter of marque, or be of a greater burthen and force, then, and not otherwise, such collector, &c. shall immediately, upon the request of the commander of such ship or vessel, give a certificate thereof in writing, under his or their hand or hands, *gratis*, to such commander: which certificate shall be deemed a necessary clearance before such ship or vessel shall be permitted to sail from that port: and, if the commander of

any ship or vessel for which any commission or letter of marque shall have been granted, shall depart before he hath received such certificate, or proceed on a cruise, with a force inferior to that specified, every such commission or letter of marque shall thenceforth be absolutely null and void; and the commander so offending shall forfeit the sum of one thousand pounds (to be recovered, with full costs of suit, by any person who will sue for the same), and shall also be imprisoned for such time as the court shall direct, not exceeding one year for any offence.

11. *Bail and security given before letters of marque are issued.*— Before the granting of any commission or letter of marque, in pursuance of this act, bail and security shall be taken as hath been usual in such cases; and, previously thereto, the persons who propose to give such security shall make oath before the judge of the high court of admiralty of England, or of any other court of admiralty which shall be authorised, in any other of his majesty's dominions, or his or their surrogates, that they are, at the time of their being sworn, respectively worth more than the sum for which they are to be bound, over and above all their just debts.

12. *Penalty on collectors granting false securities.*— If any collector, &c. shall grant a certificate for any ship or vessel not of the burthen and force specified in the commission or shall certify to a greater burthen or force, than she really is, he shall forfeit his office, be for ever incapable of holding any office under government, and shall also forfeit one hundred pounds.

13. *Letters of marque licensed under 24 Geo. 3. c. 47.*— Every ship and vessel, for which such commission or letter of marque shall be granted, and while the same shall remain in force, but no longer, shall be deemed and taken to be licensed pursuant to the act of the 24 Geo. 3. c. 47, for the more effectual prevention of smuggling in this kingdom, although the owner thereof shall not have been furnished with the license required by the said act.

14. *Letters of marque may be forfeited.*— In case the owner, or commander, of any ship or vessel, for which such commission or letter of marque shall be issued, shall be guilty of any offence contrary to any act of parliament for the protection of the customs or excise; or for the prevention of smuggling, such owner, or commander, shall forfeit the commission or letter of marque so issued, besides all other penalties and forfeitures incurred.

15. *Revoking letters of marque.*— The lords of the admiralty may revoke and make void, by any order in writing under their hands, any commission or letter of marque: nevertheless, the secretary of the admiralty shall, with all convenient speed, after such revocation, cause notice thereof in writing

to be sent to the owner or owners of the ship or vessel named or described in such order of revocation, or to his or their agent or agents, surety or sureties, or some or one of them.

16, 17, 18, 19. *Ransoms unlawful.*— It shall not be lawful for any of his majesty's subjects to ransom, or contract or agree to ransom, any ship or vessel belonging to any of his majesty's subjects, or any merchandise or goods on board the same, captured by the subjects of any state at war with his majesty, or by any persons committing hostilities against his majesty's subjects, unless in the case of extreme necessity, to be allowed by the board of admiralty. And all contracts and agreements entered into, and all bills, notes, and other securities, given, by any person, for ransom of any ship or vessel, merchandise or goods on board the same, contrary to this act, shall be absolutely null and void in law, and of no effect whatever. And if any person shall, contrary to this act, ransom, or contract, or agree to ransom, any such ship or vessel, merchandise or goods on board the same, every person so offending shall, for every such offence, forfeit five hundred pounds. And in case any commander of any of his majesty's ships, or private ship or vessel of war, commissioned as aforesaid, shall agree for the ransom of any ship, vessel, or cargo, or any part thereof, after the same shall have been taken as prize; and shall actually quit, set at liberty, or discharge, any such prize, instead of bringing the same into some port; then every such commander so acting (unless in a case of extreme necessity, to be allowed by the courts of admiralty), shall forfeit his letter of marque, and shall suffer such penalty as the said court shall adjudge, not exceeding one hundred pounds.

20. *Restoring prizes before adjudication.*— In case any ship or vessel, goods or merchandise, shall be taken or retaken, and restored by the commander of any privateer or other ship, vessel, or boat, under his majesty's protection and obedience, through consent, or clandestinely, or by collusion or connivance of such commander, without being brought to adjudication, the ship or vessel, goods, and merchandise, so taken, and retaken, and restored, and also the ship's tackle, furniture, apparel, arms, and ammunition, shall, upon proof thereof in any court of admiralty, be adjudged to be good prize to his majesty; one moiety to the use of his majesty, and one moiety to the use of such person who shall discover and sue for the same; and the bond given by the captain or commander of such privateer, or other vessel, shall be forfeited to his majesty; and such commander or captain shall forfeit one thousand pounds.

21. *In what cases re-captured ships may pursue their voyage.*— If any ship be retaken

before she has been carried into an enemy's port, it shall be lawful for her, if the re-captors consent thereto, to prosecute her voyage; and then the re-captors need not proceed to adjudication till six months, or till the return of the ship to the port from which she sailed; and it shall be lawful for the master, the owners, or their agents, with the consent of the re-captors, to deliver and dispose of their cargoes, before adjudication; and in case the vessel shall not return directly to the port whence she sailed, or the re-captors shall have no opportunity of proceeding regularly to adjudication within the six months, on account of the absence of the said vessel, the court of admiralty shall, at the instance of the re-captors, decree the restitution to the former owners, paying salvage, upon such evidence as to the said court shall, under the circumstances of the case, appear reasonable; the expense of such proceeding not to exceed the sum of four-teen pounds.

22. *Letters of marque subject to colonial regulations.*—All commanders of private ships of war, or letters of marque, shall, upon their going into any of the ports or harbours in the colonies or plantations in America, be subject to the several laws in force in those colonies relative to the carrying off any servant or slave therefrom, without the consent of the owner, or of any other person, until they have taken out his ticket from the secretary's office there.

23. *Captains deserting their convoy.* *Vessels, having dispatches on board, pursuing the enemy*—If any captain or other commander of any of his majesty's vessels of war, having transports or merchant-vessels under convoy, shall wilfully desert or sail away from them, in pursuit of, and with a view of capturing, any ship or vessel of the enemy (other than ships or vessels armed and fitted for war only, and which shall be seen hovering about or bearing down upon such convoy); or, having captured a prize, shall wilfully desert the convoy for the purpose of carrying his prize into port; or if the commander of any ship or vessel whatsoever, having his majesty's dispatches on board, shall sail out of his proper course, in pursuit, and with the view of making prize of any ship or vessel of the enemy; such commander shall, if duly convicted thereof by a court-martial, forfeit his share of every such prize to his majesty for the use of Greenwich hospital.

24. *Captains of merchant-ships under convoy disobeying orders.*—If the captain of any merchant-ships under convoy shall wilfully disobey signals or instructions, or any other lawful command of the commander of the convoy, or shall desert the convoy without leave, he shall be liable to be attainted against in the high court of admiralty for disobedience to the orders of the convoy; and upon conviction thereof, shall be fined at the discretion of the court, in any sum not

exceeding five hundred pounds, and shall suffer such imprisonment, not exceeding one year, as the said court shall adjudge.

25. *Private ships of war under convoy of his majesty's ships.*—Private ships of war, which shall receive general orders and instructions from, and put themselves under the convoy of any of his majesty's ships or vessels, shall not share in any prize or prizes taken by such ships or vessels of his majesty; or by such private ship of war, or letter of marque whilst she shall remain under the care and protection of such convoy, unless such private ship or vessel shall have received orders from the commanders of the conveying ship to chase, or otherwise act hostile against the enemy, and shall have been actually aiding and assisting in such capture.

26. *How offenders on board letters of marque are to be punished.*—All offences committed by any officer or seaman on board any privateer or letter of marque, during the hostilities with France, shall be tried and punished in such manner as the like offences are tried and punished in his majesty's fleet: provided always, that all offenders, accused of such crimes as are cognizable by a court-martial, shall be confined on board such privateer, or letter of marque, in which such offence shall be committed, until they arrive at some port in Great Britain or Ireland, or can meet with such a number of his majesty's ships of war abroad as are sufficient to make a court-martial.

27. *Prize goods not exempt from duties.*—Ships, goods, wares, or merchandise, taken as prizes, and brought into this kingdom, or any of his majesty's dominions, shall not be exempt from the payment of customs or duties, but the whole or part shall be discretionally remitted by the commissioners, if the goods be sold only from necessity, &c.

28. *Naval stores on board of captured vessels.*—The commissioners of his majesty's navy, or victualling, may purchase, for the service of his majesty, all or any naval stores found on board any ships of foreign nations, brought into any of the ports of this kingdom by any of his majesty's ships or vessels, or by any private ships of war or letters of marque; and the commissioners and officers of the customs shall suffer such naval stores, so purchased, to be entered and landed.

29. *Prize-ships considered as British-built.*—All prize-ships or vessels, which shall be legally condemned, shall, to all intents and purposes whatsoever, be considered as British-built ships or vessels, being first duly registered according to the provisions of the act of the 26 Geo. 3. c. 60.

30. *Persons breaking bulk, or embezzling prize-goods.*—If any commander, officer, seamen, mariners, soldiers, or others, shall break bulk on board, or embezzle any of the money, jewels, plate, goods, merchandise, tackle, furniture, or apparel, belonging to

any prize, he shall for every such offence forfeit his whole share therein to Greenwich hospital; and shall also forfeit treble the value of all such money, jewels, plate, goods, merchandise, tackle, furniture, or apparel, as he or they may embezzle.

31. *Ships retaken before carried into the enemy's ports.* — All captures that are conveyed, previously to adjudication, into any port or place or port abroad, that is under his majesty's dominion, must remain under the joint care of the comptroller of the customs, or the naval officer, in his stead, and of the captors or claimants thereof. Bulk shall not be broken till the delivery.

32, 33, 34, 35, 36. — Relate to the salaries of the judges to the admiralty-courts in Bahama, the Bermuda Islands, and Malta.

37, 38. *Admiralty may be directed by his majesty.* — His majesty, heirs, and successors, enjoy the right of giving directions to the admiralty, and of regulating the fees. And the table of fees is to be hung up in some conspicuous part of the admiralty-court.

39, 40, 41, 42. — Contain directions for the conduct of the judges and officers, &c.

43. *Condemnation of prizes.* — The high court of admiralty, within five days after request made for that purpose, shall finish the usual preparatory examination, in order to prove whether the same be lawful prize or not, and that the proper monition usual in such cases shall be issued and executed within three days after request; and in case no claim of such captured ship, vessel, or goods, shall be duly entered in the usual form, and attested upon oath, giving twenty days' notice after the execution of such monition; or if there be such claim, and the claimant or claimants shall not within five days from the time of entering such claim, give security in the sum of sixty pounds sterling, to pay costs to the captor or captors, in case the judge shall decree costs to be due, that then the judge of such court of admiralty shall, upon producing to him the said examination, or copies thereof, and all the papers and writings, upon oath, which may have been found in such capture, or upon oath that no papers or writings were found, proceed with all convenient speed to sentence, either to discharge or acquit such capture, or condemn the same to be good and lawful prize. And in case there shall appear no occasion to enter into any other examination, the judge shall, within ten days, if possible, after such claim made and security given, proceed to sentence; but in case it should appear doubtful to the said judge whether such capture be lawful prize, or not, and necessary, according to the circumstances of the case, for the clearing and determining such doubts, to have an examination of witnesses on pleadings given in by the parties and admitted by the judge, or such other lawful mode of inquiry

as the said judge may think requisite, such capture shall forthwith be appraised by persons well skilled in the same, to be named by the parties, and approved and appointed by the court, and sworn truly to appraise the same, for which purpose the judge shall cause, if he think fit, the goods found on board to be unladen, and an inventory thereof being first taken, cause them to be put into proper warehouses, and shall after such appraisement, and within the space of fourteen days after the making of the said claims, proceed to take good and sufficient security from the claimants to pay the captors the full value thereof, in case the same shall be adjudged lawful prize, and shall take good and sufficient security from the captors to pay such costs as the court may think proper, provided that such ship, vessel, or goods shall not be condemned; and after such security duly given, the judge shall make an interlocutory order for releasing or delivering the same to such claimant or claimants, or his or their agent or agents, and the same shall be actually released and delivered accordingly.

44. *Nett proceeds of the capture to be deemed its value.* — If the sentence or interlocutory decree having the force of a definitive sentence of such court of admiralty, &c. shall be finally reversed after sale of any ship or goods, the nett proceeds of such sale (after payment of all expenses attending the same) shall be deemed and taken to be the full value of such ship and goods; the party or parties appellate, and their securities, shall not be answerable beyond the amount of such nett proceeds, unless it appear that such sale was made fraudulently or without due care.

45. *Number included in one adjudication.* — The captors may include in one adjudication any number, not exceeding six, of such small ships, having a commission or letter of marque from the enemy, not exceeding seventy tons each, and which shall have been taken within the space of three months preceding the application to the court of admiralty for such adjudication.

46. *Writings found on board of captures.* — All books, papers, and writings, found in any ship or vessel taken as prize, shall without delay be brought into the registry of the court of admiralty, upon oath, whether such ship or vessel may be proceeded against in order to condemnation; but only such books, papers, and writings shall be made use of, and translated, as shall be agreed or insisted upon by the proctors of the several parties, captors, or claimants; or in case of no claim, by the captor or his proctor, or agent, or register, to be necessary for ascertaining the property.

47. *Expenses, in claims of joint captures.* — No claim on behalf of any asserted joint capture shall be admitted before condemnation, unless security be given at the time of

entering the same, that the party shall contribute to the actual captor in his proportion of all expense, cost, and damage that shall attend the adjudication. (Provided that nothing herein contained shall extend to the asserted interest of any admiral or flag-officer claiming to share in any prize by virtue of his flag.)

48, 49. *Appeal to commissioners.* — If any captors or claimants shall not rest satisfied with the sentence of the court of admiralty, it shall be lawful to appeal to the commissioners appointed for receiving and determining appeals in causes of prize: but the execution of any definitive sentence appealed from as aforesaid, shall not be suspended by reason of such appeal; save, as is hereafter provided, in case the party or parties appellate shall give sufficient security, to be approved of by the court, in which such sentence shall be given, to restore the effects, concerning which such sentence shall be pronounced, or the full value thereof, to the appellant, in case the sentence or interlocutory decree so appealed from shall be reversed.

50. *Appeals to be void.* — In case any person, who was not a party in the first instance of the cause, shall intervene or interpose an appeal from a sentence, or interlocutory decree, having the force of a definitive sentence, given or pronounced in any admiralty court; such person, or his agent, or agents, shall, at the same time enter his or her claim, otherwise such appeal shall be null and void.

From 51 to 57, inclusive. *Agents for prizes taken by his majesty's ships.* — All appraisements and sales of any ship, goods, wares, or merchandise, as shall be taken by any of his majesty's ships, shall be made by agents appointed by the flag-officers, captains, officers, ships' companies, and others entitled thereto; that is to say, the flag-officers or flag-officer of any fleet or squadron of ships as shall take any prize or prizes, or the majority, if more than one, shall appoint one or more person or persons, agent or agents, as aforesaid; then the captains and commanders, or captain and commander, entitled thereto, or the majority of them, if more than one, may appoint the like number to act for them, and all the other officers usually designated commissioned and warrant-officers may appoint the like number to act for them, and all the remainder of the crew usually designated petty-officers, and the seamen or marines, may appoint the like number. And the agents for prizes are to register in the court of admiralty, where the prize is condemned, their powers of attorney, within twenty days after their appointment, under the penalty of 500*l.* &c. And no person, except the agent, shall receive any part of the commission in respect of such agency business; and every person so nominated agent, (who shall

allow to be taken by any other person, as also every other person who shall receive, either himself, or by any person on his behalf, any part of such commission), shall, for every offence, forfeit and pay the sum of one hundred pounds, and also double the amount or value of what shall have been so given as aforesaid. And the registrars of the courts of admiralty shall transmit, half-yearly, to the treasurer of Greenwich hospital, copies of all letters of attorney registered in their courts, under penalty of 500*l.*: and all agents who may not be appointed till after condemnation, shall, within twenty days after the date of their power of attorney, register it under the same penalty. And every agent, on registering his first powers of attorney, shall, with two joint sureties, give bond to the court of admiralty in the sum of 5000*l.* for due execution of his trust as prize-agent: and in case of omission or refusal, his letters of attorney are null, and himself perpetually disqualified as an agent.

58. *The registrars of any courts of vice-admiralty, in America, or any other part of his majesty's dominions, shall yearly, on the 23d of October, or within three months after, transmit to the treasurer of Greenwich hospital, true copies of all letters of attorney registered in their court; which copies shall, by s. 59. be admissible as evidence of agency.*

60. *Prize list to be sent to agents.* — On every capture there shall be sent by the commander of the captured ship to the agent or agents for such capture, a list of persons entitled to shares therein; which prize-list shall be subscribed by the lieutenants, and all the signing officers then on board the ship, and shall contain the names, ages, and description of the persons entitled to share therein, the names being arranged in the same order in which they stand in the muster books, which said names and descriptions shall be taken from the description-book belonging to the said ship, and an alphabetical list, or index, of the names of all such persons shall be prefixed to such prize-list, and the same shall be examined with and corrected by the muster book of the capturing ships deposited in the navy-office, and certified by two of the commissioners of his majesty's navy; and in case no such prize-list shall be sent to such agent, he shall apply to the commissioners of the navy, and such list shall thereupon be made out from the returns in the navy-office, who shall cause the same to be made out, and certify the truth thereof under the hands of any two or more of them; and any person who shall alter the name or rating of any one in the list which shall have been so certified as aforesaid, or erase or take away name or names therefrom, or add any thereto, with intent to defraud any person or corporation whatever, shall forfeit the sum of five

hundred pounds; but this not to extend to prevent the correction of any error.

62. *Agent may be compelled to give security, where there is no claimant.* — In all cases of condemnation in any vice-admiralty court, where there is no claimant or appellant before the court, it shall be lawful for the judge to compel the agent, at the requisition of the captor, to give security at the time of condemnation for the faithful distribution of the proceeds, for the remitting thereof to the treasurer of Greenwich hospital, or to such persons in England as the captors shall appoint, under the direction of the court, for the purpose of being distributed in England.

63. *Agents to vest the proceeds in public securities.* — In all cases where there is no claimant or appellant before the court, it shall be lawful for the said court, at the prayer of the captors, to compel the agents to vest the proceeds of the property condemned, in such public securities as the captors shall elect, there to remain and accumulate for the benefit of the parties entitled till the time of appeal shall be lapsed, subject nevertheless to the further directions of the court, upon the application of the captors.

66. *Agents to transmit accounts to Greenwich hospital.* — Every agent, resident within the United Kingdom, shall within six months after condemnation, under a penalty of 500*l.* give notice of condemnation and of the state of the property, to the treasurer of Greenwich hospital.

From 67 to 72, inclusive. *Agents to exhibit their accounts of sales in the court of admiralty.* — All agents appointed shall, after the sale of any prize is completed, and before the time of the first payment of the prize-money, exhibit in the court of admiralty, in which the prize was condemned, or in the high court of admiralty, a copy of their accounts of sales duly verified upon oath, which copy shall be deposited in the public registry of the court, and all parties interested shall have liberty to object to the charges therein contained; and the said court shall confirm or disallow the accounts, upon hearing the objections, and shall make such farther order, touching the said accounts, as the case may require; and any agent who shall neglect this, shall forfeit 500*l.* to the use of Greenwich hospital, to be recovered in any of his Majesty's courts of record in any of his Majesty's dominions, and shall moreover be subject to the process of the court of admiralty, until he has obeyed the order of the said court, by exhibiting a copy of the said accounts, and until the said accounts shall be duly confirmed; and every agent shall cause advertisements to be twice inserted in the London Gazette, ten days before he exhibits in the court of admiralty his account of sales. The per-centage for agency shall be charged on the net

proceeds of prizes; and shall, as far as he is able, complete the distribution of proceeds within three months after commencing the same; but admiralty-judges may, on certificate of prize sailing under flag, or pass of enemy, allow proceeds to be distributed before the lapse of time of appeal; but such proceeds shall be liable to answer any appeal that is instituted before the expiration of such time.

73. *Agents to advertise payment.* — After the sale of any prize taken by any of his Majesty's ships, public notification shall be given by the agents appointed, for the payment of the several shares to the captors aforesaid; that is, if the prize have been condemned in his Majesty's high court of admiralty of Great Britain, then the agents appointed shall publish such notification, under their hands respectively, in the London Gazette; and if in the court of vice-admiralty, in some Gazette or newspaper of public authority, of the place where the prize shall have been condemned: and if there be no Gazette or newspaper, then in some or one of the most public newspapers of such place; and if no newspapers are there published, by affixing notice to the church, or some other public building, directed by the governor of such place; three of which advertisements or notifications shall be delivered to the principal officer of the customs, or other principal officer, resident at the place: who will transmit one of such to the treasurer of the navy, and also to the treasurer of Greenwich hospital respectively: and in every such printed or written notification, the said agents shall specify the name of the prize, and of the capturing ship, as also the precise day of the month and year in which such capture shall have been made, and their place of abode, with their names at full length, and the precise day of the month and year appointed for the payment of the several shares of the prize; and all such notifications, with respect to prizes condemned in Great Britain, shall be published in the London Gazette three days at least before any proportion of such prize shall be paid; and all such notifications with respect to prizes condemned in any other part of his Majesty's dominions, shall be delivered to the principal officers as aforesaid, one day at least before any proportion of such prize shall be paid: after which several and respective notifications, if any man's share remain in the hands of the agents, either belonging to such men as shall be run, or which shall not be legally demanded and paid within three months next after such notification, then such share remaining in the agent's hands shall be paid to the treasurer of Greenwich hospital.

74, 75. *Amount to be notified.* — On publication of payment, &c. for a prize condemned by the high court of admiralty in Great Britain; a notice of the amount of an

individual share in each class shall be transmitted to the treasurer or paymaster of the navy, and the treasurer of Greenwich hospital; and, together with delivery of any gazette, paper, &c. containing such notification, to the collector, comptroller, searcher, &c. abroad, such account shall be at the same time delivered to him, and it will be forwarded as already stated.

From 76 to 81, inclusive. *Penalty for neglect of notification.* — If any agent shall neglect or refuse to publish any notification herein required, before the payment of any part of such prize or bounty-money, and within the times herein limited, or the manner appointed, or shall not specify in such notification the matters herein directed to be specified, every agent shall for such offence forfeit and pay any sum not exceeding one hundred pounds, at the discretion of the court in which the same shall be sued: and every principal officer before-mentioned who shall omit to observe the preceding directions shall forfeit the sum of five hundred pounds.

Notifications registered at Greenwich hospital shall be evidence of agency; and the notice of bounty-bills shall be inserted in the Gazette, three days before distribution.

Four months after the first distribution, all agents for prize or bounty-money shall pay over the balances to the treasurer of Greenwich hospital, and send, at the same time, an account of the produce or amount of such prizes or bounty-money, which he shall verify on oath, and shall also deliver an authentic duplicate of the distribution or prize-list for such prizes and bounties. Any agent who shall refuse to pay the said balances within thirty days after the expiration of four months, shall forfeit the sum of one hundred pounds; or, if he shall have neglected to pay the same by the expiration of said period, the sum of five hundred pounds.

The treasurer of Greenwich hospital will transmit, with all convenient speed, to the navy-office, all the names of those persons whose shares may have been paid over to him; which extract will lie open daily (Sundays excepted) at the navy-office, for inspection, within the usual hours of business, and without fee or gratuity.

82. *An office will be kept open daily at Greenwich hospital (Sundays excepted) between the hours of nine and four, morning and evening, for the purpose of refunding.*

83, 84. *Flag, commissioned, and warrant officers may direct their shares to remain in their agents' hands, by an order in writing; but proper vouchers must be produced from the parties.*

85 to 88, inclusive. *The shares of run men forfeited to Greenwich hospital.* — No agent or agents for prizes or bounty-money shall be liable to be sued or arrested by any person who shall be made run from his Majesty's service, unless the person made run

shall, before any action brought, obtain a certificate of his *R* being taken off, and the forfeiture of his share of such prizes and bounty-monies, being discharged by the commissioners of his Majesty's navy, and shall produce such certificate to the agent, and unless the said agent, on the producing such certificate, shall refuse to pay the said prize or bounty-money, in case the same be due and payable, within three months after any such demand made, and such certificate produced.

Every agent, out of the United Kingdom, shall, within six months after the commencement of distribution, deliver up and verify his account to the vice-admiralty court which condemned the prize; and shall pay over, or remit, to the deputy-treasurer abroad residing, or the treasurer of Greenwich hospital in England, (at the option of the former) all shares, balances, &c. and shares of run men, remaining in his hands, so that the same shall have been paid to Greenwich hospital within six months after so exhibiting his accounts, on penalty of forfeiting his bond imposed by sec. 57. But, if the condemnation have passed in the East Indies, twelve months are allowed after passing his account.

The lists of prizes accounted for to the treasurer of Greenwich hospital, transmitted by the clerk of the cheque six times per annum to persons appointed by the treasurer of Greenwich hospital to receive claims, shall be open for public inspection daily, (Sundays excepted) from the hours of ten till four.

89. *When the ship is not in any of the British, Irish, or North Seas,* the treasurer may, within one month after the regular period of distribution, invest the proceeds in the security of the bank, or of exchequer bills, that the interest may accumulate for the captors' benefit: of whom, should any one apply, from change of ship or other cause, for his share, the treasurer is authorised to pay it from the prize-money which may be in his hands; or, otherwise, to dispose of part of aforesaid securities, unto the amount claimed.

All remedies granted by this act to captors for enforcing the distribution of prizes, &c. may be used by the hospital, &c. &c.

92. *Form of a letter of attorney.* — All share of prize and bounty-money due to petty officers, seamen, marines, and soldiers, shall be paid by the agent or the treasurer of Greenwich hospital, or his deputy, and the clerk of the cheque of the said hospital, or his chief clerk, to the persons entitled thereto, or persons authorised by any order to receive the same, which order shall specify the name of the particular prize; or, if the capture shall have been upon the land; the name of the place or fortress out of which the prize-money shall have arisen, together with the name of his Majesty's ship of war,

by which such prize was taken; and shall contain a full description of the person giving such order, signed by the captain and one other signing officer of the ship in which the party shall be then serving; or if the party be discharged from the service, then such order, with such description as before-mentioned, shall be witnessed by the minister and churchwardens of the parish in which he may reside: and having been admitted and paid, shall remain with the agent of the treasurer of Greenwich hospital, or his deputy, paying the same, and shall be in the following form:

Ship
or
Place. } Date.

At one day's sight pay to A. B. or his order, the sum of (*in writing*) being the amount of my share of prize or bounty-money for the capture of

when serving as (*quality*) on board his Majesty's ship or vessel the (*name*) (*or if the amount of such share shall not be known by the person making the order, then in lieu of the words "the sum of (in writing) being the amount of my share of," insert "my share or proportion of."*)

To C. D. agent for the said
capture, or, the treasurer
of Greenwich hospital,
London. }

These are to certify, that we have examined the said C. D. who signed the above order in our presence, and from the documents (*to be stated*) which he has shown us, and his answers to our questions, we have reason to believe he was serving on board the said ship at the time of making the capture above specified; he says he was born at

in the county of and
that he is years of age; he
is of a (*fair, brown, or sallow*) complexion, with (*dark, or, light*) eyes; has
(*black, brown, light, red, or grey*) hair,
(*describing any other particularity of his person.*)

Given under our hands,

G. H. captain, }
E. F. signing } of His Majesty's
 officer, } ship

But if the party should not, at the time of making the order belong to any of his Majesty's ships, then shall be added under the said description:

The said C. D. says, he was discharged from His Majesty's ship or vessel the
by reason of his being
invalided, (or, as the case may be.)

L. M. Minister }
N. O. } Churchwardens } of the parish
P. Q. } or Elders } where the
 } said C. D.
 } resides.

Provided always, that from and after the expiration of three years next after any prize or bounty-money shall be paid to the treasurer of Greenwich hospital pursuant to the directions of this act, all such shares of the said prize and bounty-monies as shall then remain unclaimed in the hands of the said treasurer or the said commissioners and governors of the said Royal hospital, shall be paid and refunded to the officers, seamen, marines, and soldiers, claiming and making title to the same, and their legal attorneys and representatives, in such and the same manner as has been heretofore adopted by the said Royal hospital, or in such other manner as the said directors may at any time hereafter judge more convenient and proper, and the stamp-duty on such instrument or special power of attorney shall not exceed one shilling for each person subscribing the same.

94, 95. *The treasurer is enabled to appoint deputies at such ports or places, within the United Kingdom, as he may think fit, whose duty it is to transmit to the clerk of the cheque of Greenwich Hospital all applications in the form hereafter mentioned. And any person desirous of recovering any prize or bounty-monies paid into Greenwich hospital shall transmit to the clerk of the cheque his application and such certificates as he may possess: which application will be referred, by such clerk, to the navy-office: by which, if the certificate, &c. be found correct, the clerk shall certify the same to the treasurer, who shall hereupon send remittance-bills for the amount in the form hereafter-mentioned; or otherwise pay it in any mode that he may, from time to time, judge expedient.*

96. *Mode of refunding shares. — If such claimant reside at a place where there is no such deputy as aforesaid, on application to the treasurer, secretary, or clerk of the cheque, by letter or otherwise, he will be furnished with blank forms to be filled up and attested by the minister, church-wardens, or elders, of his parish: and, on transmitting the same, together with his vouchers as aforesaid, he will receive the amount, after the process already described, either on application at the proper office in Greenwich Hospital, or, if this be inconvenient, by a remittance-bill, or any other method that the treasurer may think fit to employ.*

97, 98, 99. *For facilitating the payment of prize and bounty-money. — It shall be lawful for the said treasurer of the said Royal hospital, or his deputy, to make out two bills for every sum which they shall have occasion to pay to any person of the description last hereinbefore-mentioned, which bills shall be duplicates, and joined together with oblique lines, flourishes, or devices, in such manner as the said treasurer or his deputy shall think proper; and shall be payable to such per-*

son by the receiver-general of the land-tax for any county, riding, or city within the United Kingdom, by the collector of the customs for any port, or collector of excise for any collection in the United Kingdom respectively, near which place such person shall happen to reside, according to the appointment of such bills, and being numbered and dated, they shall be signed by the said treasurer or his deputy, and attested by the clerk of the cheque of the said Royal hospital, or his chief clerk, and be written or printed according to the following form, or such other as the treasurer of the said hospital shall from time to time deem convenient.

Royal Hospital, Greenwich.

Sir,

Pay to _____ of _____ in the county of _____ upon producing the duplicate hereof, together with a certificate under the hands of the captain, and one other signing officer of the ship to which such belongs, (in case he is in His Majesty's naval service) or of the minister and churchwardens (or, *in that part of the United Kingdom of Great Britain and Ireland called Scotland, under the hands of the minister and two elders*) of the parish where he resides, (in case he is not in such naval service) that to the best of their knowledge and belief, he is the person named in such bill, the sum of _____ sterling, being on account of monies due to the said _____ for captures made by His Majesty's ship _____ if the same shall be demanded within six calendar months from the date hereof, otherwise you are to return this bill to the treasurer of the said Royal hospital.

Attested

{ Treasurer or his
Deputy.
Clerk of the
cheque of the
said hospital or
his chief clerk.

To the receiver-general
of the land-tax of the
county of }
To the collector of the
customs of the port
of }
To the collector of ex-
cise at }

N. B. The personating or falsely assuming the name and character of any person entitled, or supposed to be entitled to prize-money, for services performed in His Majesty's navy, in order to receive the same, is felony, without benefit of clergy.

And as soon as the bills shall be made out and signed, the treasurer or his deputy shall cause them to be cut asunder indentwise,

through the oblique lines, flourishes, or devices, and shall cause one of the said bills to be transmitted forthwith to the person nominated and appointed as the payer in such bills, and the other of the said bills shall be transmitted forthwith to the said receiver-general of the land-tax, collector of the customs, or collector of the excise, on whom such bills shall be drawn as aforesaid; and the said persons, if the said bills shall be produced and delivered to either of them respectively within six months, if in Great Britain, and if in Ireland then within nine months, from the date hereof, will enquire into the truth thereof by the oath of the person producing the same, or, such person being a quaker, by his solemn affirmation, and upon being duly satisfied, are to testify the same on the back of such bill, and immediately to pay the bill to such person, without fee or reward, on any pretence whatsoever, taking his receipt for the same on the back thereof; but in case the duplicate of such bill shall not be produced and delivered, and the payment thereof be demanded within six or nine calendar months from the date, as the case may be, as aforesaid; or if a proper certificate of the person claiming such a prize or bounty-money be not likewise received, then the said receiver-general, &c. shall return such bill to the treasurer of the said Royal hospital, or his deputy, who shall cause such bill to be cancelled; and from and after the cancelling of the same, such prize and bounty-money shall remain payable in like manner as if the said bill had not been made out; all which said bills and receipts to be so made and given, and also all other receipts for prize and bounty-money, which shall be at any time paid and refunded by the treasurer of the said Royal hospital, or his deputy, to any person or persons whatsoever, shall be free from any duty of stamps whatsoever; and such bills will be repaid by the treasurer to the said receiver-general, &c.

100. *Penalty on receiving fees for refunding.* — No person paying any share or balance of prize-money remitted from Greenwich hospital, shall receive any fee or reward on account of any payment thereof, or of any act relating to the procuring of the payment of the same under any pretence whatever, on pain of forfeiting one hundred pounds.

101, 102. *Official letters free of postage.* — All letters or packets addressed to the treasurer of the said Royal hospital upon any business relative to such prize matters shall be free from the duty of postage, and also all letters or packets sent by the treasurer, or by the secretary of the said Royal hospital, or by the officer for prize matters in the navy-office, upon any such business.

103. *All commanders of His Majesty's ships and vessels of war, or hired armed ships, shall, from time to time, as soon as the same can be done, transmit to the clerk of the*

cheque, of the said hospital, accounts in writing of all prizes taken, with the name of the port to which the capture was sent, and the name and place of abode of the agent, whether it is a single or joint capture, and if joint, the names of the several ships alleged to be aiding in such capture, with the date of the capture, and the place where the same was made.

104. *The prize-money to the representatives of petty-officers, seamen, and marines, deceased,* shall be paid only to their representatives, or their lawful attorney, upon production of the cheque to be granted by the inspector of seamen's wills.

105 and 106 relate to the mere forms of office.

107. *Persons employed by Greenwich Hospital,* in executing the regulations of this act, shall not act as agents for prizes, or be concerned directly or indirectly in the business thereof, under the penalty of five hundred pounds.

108, 109. *Persons retaining proceeds of prizes to pay interest.*—Any captor, agent, or other person, who shall acquire or retain the proceeds of any prize contrary to the provisions of this act, except for reasonable cause, shall pay interest thereon at the rate of one pound per cent. per month, for such time as the same shall so be in his custody or possession, besides all other penalties imposed by this act.

110, 111, 112. *Perjury and forgery.*—A forfeit of five hundred pounds is imposed for the forging, altering, falsifying, &c. any document requisite for the purposes of the act; and the pains and penalties of wilful perjury are applicable to the commission or subornation of a false oath. Also a penalty of one hundred pounds is forfeited by the neglect or refusal of delivering in accounts to the treasurer of Greenwich hospital; and every person who shall commit, admit, or connive at, any fraud or collusion in stating or balancing accounts, is subject to the fine of five hundred pounds.

113. *Unclaimed shares of soldiers.*—All unclaimed shares of soldiers serving in any conjoint expedition with his Majesty's naval forces, as described in this act, shall be paid to the treasurer of Chelsea hospital, within six months after distribution commenced; subject nevertheless to be refunded to any individual entitled to the same, and establishing his claim within six years from such payment: and it shall be lawful for the said treasurer to compel the agents for the army, to exhibit and verify their accounts, and pay over such balances, in like manner as the treasurer of Greenwich hospital is herein empowered to compel the producing and verifying of accounts and payment of unclaimed shares from the naval prize-agents; and the high court of admiralty shall exercise the same powers and authorities for discovering and compelling of payment of all

shares of soldiers so remaining unpaid, in this or any former war, in like manner as the said court is enabled to do by this or any other act, respecting the unclaimed shares of mariners serving in His Majesty's ships of war.

This is all of the statute which it has been considered necessary to detail here, as the remaining sections relate almost entirely to the execution of the provisions of it by the courts and their officers, and in an insignificant degree to the merits of the claimants.

In pursuance of the powers given by the preceding statute to the crown, a proclamation was issued for the distribution of prizes during the last war; but as all instruments of this description are for an occasional purpose only, and are governed by the circumstances of the period at which they are promulgated, it has been conceived unnecessary to insert them.

Further provisions, as to naval prize-money, are made by 59 Geo. 3. c. 56. and by 1 Geo. 4. c. 58. We add, on this part of the present subject, the substance of a few recently-determined cases, some of which, though to a certain degree bearing reference to particular provisions in the proclamation above adverted to, are all decided on general views and applicable in principle to all times.

A flag-officer, who, after giving orders to one of the ships under his command to cruise, received an appointment to another command, is not entitled to share in a prize taken, after the acceptance of such appointment, by the ship so sent by him to cruise, the ship not being actually under his command at the time of capture. *Johnson v. Marguson*, 1 H. Black. R. 261.

By article four of the king's proclamation respecting distribution, as to flag-officers, it is directed that a chief flag-officer, returning home from a foreign station, shall have no share of prizes taken by ships left behind to act under another command. This applies as well to a command devolving by seniority, as to one by express commission; on returning home, means, commencing of departure from a local station. *Nelson v. Tucker*, 4 E. R. 258.

A commodore who appoints a captain under him, without authority for that purpose, is not entitled to share as a flag-officer; nor will a subsequent retraction of the appointment bear reference back to prizes taken before it. *Donnelly v. Popham*, 1 Taunt. R. 1.

An officer under arrest on board a fleet for an offence of which he is afterwards acquitted, is entitled to prize-money taken during such arrest. *Lumley v. Sutton*, 8 T. R. 224.

A second captain is entitled to a captain's share of prize money, under the king's proclamation. *Waterhouse v. King*, 2 E. R. 507.

Every instrument by which a seaman or marine conveys his prize money or wages in

the hands of the public officers, must be in the form prescribed by the statutes. *Turtle v. Heartwell*, 6 T. R. 426.

By an Act for the Relief of the Captors of Prizes, with respect to the bringing and landing certain Prize Goods in this Kingdom (33 Geo. 3. c. 34, continued, during hostilities, by 43 Geo. 3. c. 134.) it was provided, that

1. *Prize goods, after condemnation, may be landed upon payment of certain duties.*—

Any goods, wares, or merchandise, taken during the continuance of the hostilities with France, and brought into Great Britain by any of his majesty's ships of war, or any privateer, shall and may, upon condemnation thereof as lawful prize, be landed within any port within this kingdom, and secured, under the king's locks, in warehouses provided at the sole expense of the captors, with the privity and approbation, and under the care and inspection respectively, of the commissioners of customs and excise; and, upon admission of any such goods into such warehouses, there shall be paid by the captors or their agents the certain duties therein specified respectively.

2. *Prize goods duty free.*—No duties whatever shall be taken for any prize goods, consisting of military or ship's stores, viz. sails, cordage, anchors, and cables, masts, yards, bowsprits, blocks, guns, gunpowder, shot, match, gun-carriages, cartridges, and other materials thereunto belonging, and all timber and iron converted into and made fit for ship-building, or for any of the uses and purposes aforesaid; salted beef, pork, and butter, biscuits, small beer, pease, and oatmeal, sailor's clothes, hammocks, bedding, and apparatus and instruments belonging to surgeons, or for any goods which by any law in force, on and immediately before the passing of this act, may be imported into this kingdom duty free: and no public or private ship or vessel of war, that shall have been taken from the enemy, or any part of her sails, cordage, &c. as aforesaid, shall be subject to any duty whatever.

3. *Prize wheat, &c.*—All wheat, wheatmeal, or flour, rye, barley, beer, or bigg, oats, oatmeal, pease, beans, Indian corn, and maize, taken and condemned as prize, shall, on being brought into any port of this kingdom, be warehoused, and subject to such rules, restrictions, duties, penalties, and forfeitures, as are provided and enacted in the act of 31 Geo. 3. c. 30.

4. *East India or Chinese prize goods.*—All goods of the growth, production, or manufacture of China or the East Indies, taken or condemned as prize, shall be publicly exposed to sale in the city of London, by the captors or their agents, notice of such sale being first given to the proper officers of the excise or customs respectively concerned therein; and such goods shall be

sold on such conditions, and under such rules, regulations, and restrictions, as are used and practised at the sales of the East India Company, and the goods shall be subject to such duties, and entitled to such drawbacks, as the like goods are subject and entitled to when imported by the East India Company, and the full duties due and payable on such goods shall be paid in all cases by the captors or their agents. Which regulations are further extended, in point of continuance, by 54 Geo. 3. c. 36.

5. *Prize tobacco and snuff.*—Tobacco and snuff of all sorts taken as prize, and brought into any port of Great Britain, not being a port enumerated in the act of the 29th of Geo. 3. c. 68. and in the act of the 51st of Geo. 3. c. 47. shall be removed according to the provisions of the said act the 29th of Geo. 3. as soon as may be, under the usual coast dispatches and security, to some of the ports enumerated in the said act; and such tobacco and snuff, and also tobacco and snuff of all sorts, taken as prize, and brought into any port enumerated in the said act, shall, on condemnation as prize, be warehoused in his majesty's tobacco-warehouse at such port, and be liable to warehouse rent, at the rate of one penny per week for every hogshead, or other package; and such tobacco or snuff may be exported from such warehouse, without payment of any duty, or may be taken out of such warehouse for home consumption or manufacture, on payment of the duties due and payable on tobacco and snuff of the growth and production of his majesty's colonies, plantations, islands, or territories in America; and such tobacco and snuff, so warehoused, shall be subject to the rules, regulations, penalties, and forfeitures, as are provided and enacted with respect to warehoused tobacco and snuff.

6. *Removing of prize goods for exportation.*—Whereas it may, in some cases, be impracticable for the captors to procure vessels to export prize goods directly from the ports where they are warehoused, in pursuance of this act; for remedy whereof, it shall and may be lawful for the commissioners of his majesty's customs, in any case where they shall think proper, to order such goods so secured in any warehouse in this kingdom, tobacco and snuff excepted, to be removed thence for exportation to any custom-house warehouse, at any other place or port in Great Britain, by and under the seal of office of the collector, &c. of the customs at the port whence the goods are intended to be so removed, at the expense of the captors or other person who may have purchased the same.

7. *Prize goods condemned abroad.*—All goods taken as prize, and condemned abroad, shall, on importation into Great Britain, be entitled to the benefit and indulgence granted to prize goods by this act, provided a certi-

ificate, under the hand and seal of the judge of the court in which such goods shall have been condemned, shall be produced to the collector, &c. of the customs at the port or place into which such goods shall be imported, certifying the condemnation thereof, and the master of the ship on board of which such goods shall be imported, shall, together with the importer, proprietor, or consignee, make oath before the said collector, &c. that to the best of their knowledge and belief, the goods so imported are the identical goods mentioned in the said certificate of condemnation.

8. *East India and Chinese prize goods, condemned at an out-port to be brought to London.* — Whereas goods of the growth, production, or manufacture of China or the East Indies, taken as a prize, may be carried into some of the out-ports of this kingdom, and condemned; in all cases, therefore, where such goods shall be carried into any out-port in this kingdom, and condemned as prize, bond, with sufficient security, shall be given to his majesty, in treble the value of such goods, that the same shall be brought to London, and delivered to his majesty's warehouse-keeper at the custom-house for the port of London, to be deposited by him in warehouses provided at the expense of the captors, or their agents, and approved by the commissioners of the customs: and with farther condition to produce a certificate from such warehouse-keeper, within three months from the date of such bond, that the goods have been delivered accordingly; and if such goods shall be sent by land-carriage, they shall be removed under the seals of office of such collector, &c. and shall be accompanied by a transire, expressing the number and make of the packages; and all such goods so removed, either by land or water, shall afterwards be publicly exposed to sale in the city of London, by the captors or their agents, they giving notice of such sale to the proper officers of the customs or excise respectively concerned therein, by the same rules, regulations, and restrictions, in all respects, as the duties payable on the like goods, imported by and sold at the sales of the united company of merchants of England, trading to the East Indies, are computed and charged, and the duties due by law thereon shall be accordingly paid.

9. *Duty on prize ships.* — Any foreign ship or vessel, not being a ship of war, or private vessel of war, having been condemned as prize, shall pay the duty enacted, on arrival in port; and, if it be not paid within three calendar months after such arrival, may be sold by his majesty's commissioners; one part of the produce to defray the duty, another the charges of detention, and the remainder to be paid to the proprietor.

10. *Exporting of prize goods.* — Any prize goods which shall be received into any ware-

houses in pursuance of this act, may, upon payment of the respective duties before directed, be exported at any time directly thence, without paying any further duty of customs or excise for the same; the person or persons exporting the same giving sufficient security, in double the value of the goods, that the same shall be really and truly exported, and not brought back again or relanded in any part of Great Britain, or landed in the islands of Guernsey, Jersey, or Man, or the islands Faro or Ferro.

By the 35 Geo. 3. c. 31. s. 3. the island of Alderney is placed in the same condition as Guernsey, &c. as to this prohibition.

11. *Prize goods for home consumption.* — If any goods shall be taken out of any warehouse wherein they are secured as aforesaid, to be consumed in this kingdom, the person so taking out the same shall first pay up the remainder of the duties which would have been due and payable to his majesty thereon, if the same had been regularly imported by way of merchandise into this kingdom; and such goods shall, in all other respects, be liable to the same restrictions and regulations to which they would have been subject if this act had not been made.

12. *Privateers having on board liquors, &c. in illegal quantities.* — If any ship or vessel whatever, which shall be commissioned by letters of marque, or general reprisals, or otherwise, shall be found at sea, or in any port of this kingdom, or at any distance from the coasts thereof, having on board any foreign brandy, or other foreign spirituous liquors, in any vessels or casks which shall not contain sixty gallons at the least, except only for the use of the seamen, not exceeding two gallons for each seaman, or any tea exceeding the quantity of six pounds weight, or any goods whatever, which are or may be liable to forfeiture by any act of parliament, upon being imported into Great Britain, then not only all such goods, but also the ship or vessel, on board which they shall be found, with all her guns, furniture, ammunition, tackle, and apparel, shall be forfeited and lost, and the letters of marque, or general reprisals, or any other commissions for such ship or vessel, shall be null and void.

Abstract of an Act to exempt Ships of War, and Private Ships or Vessels of War, taken as Prize, from Payment of Duty. 34 Geo. 3. c. 70.

1. No ship of war, nor any private ship or vessel of war, which shall be taken from the enemy, and legally condemned as prize, nor the sails, or any of the tackle, apparel, or furniture, belonging to such ship or vessel, shall be chargeable with, or liable to pay, any duty whatever, any law, custom, or usage, to the contrary notwithstanding.

2. In case any duty shall have been paid according to the laws now in force for ships

or vessels of the description before-mentioned, taken since the commencement of hostilities in the present war, or upon their sails, tackle, apparel, and furniture, the commissioners of his majesty's customs in England or Scotland may cause the same to be repaid in such manner as they shall judge proper.

The payment of army prize-money is regulated by 1 Geo. 4. c. 84.

PRIZE SHIPS. The Danes and Swedes being at war, it became a question — "in what light prize ships taken by one or other of those powers should be considered?" — Sir Edward Northey (Att. Gen.) was of opinion, that a Danish ship being taken a prize by the Swedes, and condemned in the court of admiralty in Sweden, the property was altered, and the British subject might lawfully purchase such ship; and such ship being owned by British subjects, might import timber from Sweden; but Swedes being owners of such a ship, could not import timber thence, such ship not being of the build of Sweden; which opinion seems well founded: for though prize ships with us are favoured in the same manner as British built, this is by special provision in an act of parliament, and nothing similar being enacted with regard to ships taken prize by any foreign power, that circumstance of their being taken prize, cannot make them of the build of that country, as the law expressly requires them to be. *Reeves on Shipping*, p. 177.

Stat. 7 and 8 Will. 3. directed all prize ships to be *specially registered*, mentioning the capture and condemnation, instead of the time and place of building, on proof upon oath that the entire property was British. Besides the register, it had become the practice, in order to make all the circumstances of these ships appear more at large, to grant to the owners of them another document called a *certificate of freedom*; but this practice does not seem to have obtained in Scotland: this certificate recited when, and by whom, the duties on such prize-ships were paid.

The owners of prize-ships, before registering, are to produce a certificate of the condemnation, under the hand and seal of the judge, and also an account of the particulars contained in the before-mentioned certificate, to be made and subscribed by skilful persons appointed by the court to survey the ship; and they are to make oath that the ship in question is the same mentioned in the judge's certificate. Prizes condemned in Guernsey, Jersey, or the Isle of Man, are to be registered at Southampton, Weymouth, Exeter, Plymouth, Falmouth, Liverpool, or Whitehaven. This was to secure the duties payable on such ships; and, for the same purpose, when such prizes are registered in the plantations, an exact and particular account is to be joined to the certificate of registry of the sum the ship sold for, verified by the oath of the person

applying for the register. — *Reeves on Shipping*, p. 436. See PRIZE, and REGISTER.

PROA, *Flying*, in navigation, is a name given to a vessel used in the South Seas, because, with a brisk trade-wind, it sails near twenty miles an hour. In the construction of the proa, the head, and stern, are exactly alike, but the sides are very different; the side intended to be always the lee-side being flat, and the windward-side made rounding, in the manner of other vessels; and, to prevent her oversetting, which, from her small breadth, and the straight run of her leeward side, would, without this precaution, infallibly happen, there is a frame laid out of her from windward, to the end of which is fastened a log, fashioned in the shape of a small boat, and made hollow. The weight of the frame is intended to balance the proa, and the small boat is by its buoyancy (as it is always in the water) to prevent her oversetting to windward; and this frame is usually called an out-rigger. The body of the vessel is made of two pieces joined endwise, and sewed together with bark, for there is no iron used about her; she is about two inches thick at the bottom, which at the gunwale is reduced to less than one. The sail is made of matting, and the mast, yard, boom, and out-riggers, are all made of bamboo.

PROBAT, or **PROBATE**, the proof of wills and testaments of persons deceased, in the spiritual court, either by the oath of the executor, or with witnesses, See WILL.

PROCTOR, a person commissioned to manage another person's cause, in any court of the civil, or ecclesiastical, law. A proctor is in the spiritual court, what an attorney is in common law.

PROCURATION. Where a merchant resident abroad appoints his agent or correspondent, or where a merchant, during his absence from the seat of his business, empowers his clerk to accept, or indorse, bills on his account, this is termed acceptance, or indorsement, by procuration, and the principal will be bound by such act. See LETTER OF ATTORNEY.

PRODUCE, in mercantile affairs, is a term applied to the indigenous merchantable commodities of any territory. Thus we call sugar, coffee, cotton, and the like, "West India produce;" hemp, flax, and wood of different kinds, "Russian produce," &c. &c.

PROFIT, is the advantage or emolument which a trader acquires by trafficking in goods of any kind. Some trades afford better profits than others, and sometimes local circumstances, and casualties of various descriptions, either improve, or depress, the profits of particular branches of industry and commerce. Five-and-twenty per cent. is considered the general standard of profit among manufacturers.

PROFIT and LOSS, in arithmetic, is

that rule which discovers what is gained or lost in the purchase and sale of goods, and it teaches persons how to fix the price of their goods, so as to gain a certain per centage.

PROFIT and LOSS, in book-keeping, is a separate account inserted in the ledger, exhibiting at one view the gains, and losses, of a merchant in the course of his trade, however complicated it may be.

PROHIBITED GOODS, are such goods as are not allowed to be either exported, or imported. *See* **CONTRABAND**, and **SMUGGLING**.

PROMISE is where, upon a valuable consideration, persons bind themselves by words to do or perform such a thing agreed on; it is the nature of a verbal covenant, and wants only the solemnity of writing, and sealing, to make it absolutely the same. Yet from the breach of it, the remedy is different; for instead of an action of covenant, there lies only an action of assumpsit, the damages whereof are to be estimated and determined by a jury.

PROMISSORY NOTE, a note of hand, purporting the payment of a certain sum, at a stated period.

Form of a Promissory Note.

London, 20th July, 1809.

£150.

Two months after date, I promise to pay to John Johnson, Esq. or order, the sum of one hundred and fifty pounds, for value received.

GEORGE DAVIS.

Generally interest, after a specified rate, is also added; but if there be no such insertion, it is, nevertheless, recoverable after the rate of 5*l*. per cent., that being the highest rate of interest the law allows. *See* **BILLS OF EXCHANGE**.

PROOF, the shewing or making plain the truth of any matter alleged: either in giving evidence to a jury on a trial, or else on interrogatories, or by copies of records, or exemplifications of them.

PROPOLIS. The propolis, bee-glue, or mastic of bees, is well known to be the first matter collected by the bees of a swarm, newly placed in a hive. This substance is resinous, ductile, odorant, and of a reddish brown colour, more or less deep. It is at first soft and very extensible; but it hardens, and at last becomes solid.

It is not yet known from what part of plants it is extracted: it is believed that it comes from that species of gum-resin which coats, and defends, most of the buds of trees and shrubs from wet. In the mass it is blackish; but it is semi-transparent when in thin plates. The heat of the fingers is sufficient to soften it, and give it all the ductility of wax; but it is more ropy and tenacious. Like wax, it may be kneaded between the teeth, without any perceptible taste. Its odour is aromatic, resembling that of mellilot, of balsam of Peru, or of the Banana poplar,

PROTECTION is a privilege from being impressed, and it is granted by the admiralty to different descriptions of persons.

The following persons are, by several acts of parliament, privileged from being impressed:

Two able seamen for every ship of 100 tons, and one for every vessel of 50 tons; parish-apprentices, under eighteen years of age; all other apprentices, for three years from the date of their indentures, except persons above the age of eighteen, who have been at sea before they became apprentices, and all under eighteen years of age, and above fifty-five; foreigners in merchantships and privateers, and landmen, betaking themselves to sea for three years.

The following persons in the fisheries are also entitled to protections:

Masters of vessels or boats, who, either themselves or their owners, within six months before applying for protection, shall have had one apprentice or more under sixteen years of age, bound for five years, and employed in the business of fishing on the coast, or on any of the rivers; four apprentices to every master or owner of any fishing-vessel of thirty tons or upwards, and two to every vessel or boat under thirty tons, during the term of their apprenticeship, and until the age of twenty years, provided they continue during that time in the business of fishing only; one mariner, besides the master and apprentice, to every fishing-vessel of ten tons or upwards, during his continuance in such vessel; and every landman on board such vessel, for two years from his first going to sea, and to the end of the voyage he is engaged in, if he so long continue.

To obtain a protection from the admiralty, an affidavit must be produced, stating that the party comes within one of the preceding descriptions, inserting also the name of the vessel, port, master, age of the apprentice, term of apprenticeship, and date of the indenture, or the name of the landman, mariner, &c. requiring such protection; and if any persons so protected shall be impressed and detained after producing such protection, the officer shall forfeit 20*l*. to the party injured.

Six harpooners to every ship of two hundred tons, employed in the whale fisheries, and so in proportion for any less tonnage, are also entitled to protections.

PROTEST, that act by which the holder of a foreign bill of exchange declares that such bill is dishonoured. The protest is a solemn declaration drawn up upon a separate piece of paper, that the bill has been presented for acceptance or payment, which was refused, and that the holder intends to recover all damages which he, or his principal, or any other party, may sustain, on account of the non-acceptance or non-payment.

A protest is absolutely necessary on a fo-

reign bill of exchange, where it is refused acceptance, or payment, in order to charge the drawer. The payee must demand acceptance from the drawee before protest.

If payee die, there can be no protest before probate or administration.

If a bill, left for acceptance, be lost, the drawee must give a note for the payment thereof; otherwise it may be protested.

If a bill be lost, and no new one can be had, and the drawee does not insist on having the original, but refuses payment on another account, a protest made on a copy is sufficient.

A protest is good evidence of non-acceptance, or non-payment, until the contrary is proved.

A protest on a foreign bill is necessary to recover, against the drawer, not only interest and costs, but also principal; and such protest must be made in due time, and timely notice given to the drawer. What is a *timely* notice must be determined by the customs of the merchants. Convenient notice must be given to the drawer of an inland bill; which notice, as to time, must also rest upon the custom, and verdict of a jury.

But, in case of non-payment of either foreign, or inland, bills, the safest way is to give as early notice, to the person of whom it was received, as possible; that is, by the first post, or, rather, to send the bill to a correspondent, to tender it to the drawer, or indorser. Where they refuse to accept the bill, it may be protested, before the day of payment, for better security but not for non-payment.

Form of a Protest.

On this day, the of one thousand eight hundred and I,

of the city of London, Notary Public, by lawful authority duly admitted and sworn, did exhibit the original bill (or note) on the other side, copied to at

and demanding payment thereof, was answered by that the said bill (or note)

Therefore, I, the said notary, have protested, and by these presents do solemnly protest, as well against the drawer or subscriber of the said bill (or note), as against all others whom it may concern, for exchange, re-exchange, and all costs, damages, charges, commissions, and interests, suffered and to be suffered for want of payment (or acceptance) of the said bill (or note). This done and protested in my office, at London, the date aforesaid. — *Quod attestor.*

(Seal.) NOT. PUB.

On the back of this protest is to be made an exact copy of the bill or note protested, together with a list of the indorsers on such bill or note.

The notary's fees of office, for noting and protesting bills, are settled by general acquiescence. The last regulations were by a general meeting of notaries in 1797, the resolutions of which meeting were approved by the Governor and Company of the Bank of England, and form the rule of charging at this time.

The stamp-duties on these instruments are as follows.

PROTEST of any bill of exchange, or promissory note, of any sum of money, not amounting to 20*l*. - 0 2 0

Amounting to 20*l*. and not 100*l*. 0 5 0

Amounting to 100*l*. and not 500*l*. 0 5 0

Amounting to 500*l*. or upwards 0 10 0

Protest of any other kind. - 0 5 0

And for every sheet upon which the same shall be written, after the first, a further duty of - - - 0 5 0

PROW, in navigation, denotes the head or fore-part of a ship, particularly in a galley, being that which is, opposite the poop or stern.

PRUNE. See PLUM.

PRUNE, French, (GER. *Katharinensplumen*. DU. *Cathryne pruimen*. DA. *Catrineblommer*. SW. *Catarine plommon*. FR. *Pruneaux de Ste. Catharine*, *Pruneaux de Tours*. IT. *Prugne*, *Susine sicca de Santa Catharina*. SP. *Ciruelas pasas de Santa Catharina*. PORT. *Ameixas secas de Santa Catharina*.) or, as they are sometimes called, Saint Catharine's plums, constitute a lucrative branch of traffic, exclusively carried on by Tours and Châtellerault, two flourishing towns of the French empire. They are prepared with the greatest care at the places where they are grown, and are thence sent to the merchants of Tours and Châtellerault, who supply every other part of France, as well as foreign countries, with the article. They are of different qualities. The best are packed in hampers or baskets made of white osiers, weighing from six, to ten, pounds each; the second quality in quarters, and the third in puncheons. The grand purchases of this fruit are made at the commencement of the new year, and about the beginning of Lent; during which penitential season, the demand is particularly great at Paris, and in other large cities and towns of France. Vast quantities of these prunes are exported to the north of Europe. Their flavour is peculiarly grateful to the palate, and they are said to be extremely wholesome, when taken in moderation.

PRUNELLA is a name given to a sort of silken stuff, but whence derived in this sense does not appear.

It is also a name given by physicians to a certain species of sore throat, of the quinsy kind.

It is also the name of a salt in pharmacy, prepared from purified salt-petre.

PRUNELLO, or PRUNE OF BRIGNOLIA, GER. *Prunellen*. DU. *Pruimellen*, *Prunellen*.

DA. and Sw. *Bruneller*. FR. *Prunés de Brignoles, ou Brignolles*. IT. *Susine di Brignola*. SP. *Ciruelas de Briñola*. PORT. *Ameixas de Brinhola*. RUS. *Smokwa*. POL. *Brunele, Prunele*. LAT. *Pruneolæ, Pruna Brignolensis*.) a sort of French prunes, of which large quantities are annually gathered in Provence, especially in the neighbourhood of Brignolles, whence their name. A very great trade is carried on in the article by the merchants of Provence. This fruit is very different from the common French prunes, though somewhat larger.

PRUSSIAN BLUE. (GER. *Berlinerblau*. DUT. *Berlyns Blaauw*. DA. *Berliner Blaåt*. SW. *Berliner blått*. FR. *Bleu de Prusse*. IT. *Azzurro Prussiano di Berlino*. SP. *Azul de Prussia*. PORT. *Azul de Allemanha de Prussia*. RUS. *Lasor Berlinskaja*. LAT. *Cæruleum Berolinense*.) Iron is the basis of this fine blue pigment, called, from the place where it was first discovered, Berlin, or Prussian, blue. This colour was accidentally discovered about the beginning of the last century, by a chemist of Berlin; who, having successively thrown upon the ground several liquors from his laboratory, was much surprised to see it suddenly stained with a beautiful blue colour. Recollecting what liquors he had thrown out, and observing the same effects from a similar mixture, he prepared the blue for the use of painters, who found it might be substituted for ultramarine, and have used it accordingly ever since. The process of manufacturing Prussian blue is by calcining a quantity of vegetable alkali, with twice its weight of dried bullocks' blood, until the blood be reduced to a perfect coal. This coal is boiled in water, the lixivium decanted, and poured into a solution of one part of green sulphat of iron (copperas) to six of alum, the lixivium, and the solution, both hot. The mixture will then acquire a very pale blue colour, and deposit as pale a precipitate. On adding more and more of a fresh solution of copperas, the colour becomes deeper and deeper. In order to separate the precipitate, it is now filtrated, the next day washed till the water comes from it insipid, and the blue colour is, finally, gently dried. See BLUE.

PUBLICANS, INNKEEPERS, &c. Persons retailing beer or spirits, by virtue of a license from the magistrate. This being a general term, including innkeeper, alehouse-keeper, public-houses, and keepers of wine-vaults, every thing relating to these several branches of business may be classed, with propriety, under the general term publicans; but, as innkeepers, although publicans, as retailers of the same article, are in some degree distinct, as preparing and selling victuals to their guests, the substance of the regulations which constitute the responsibility of innkeepers are first given, which will be followed by those relative to publicans, &c. which are common to all

This subject may be divided as follows:

1. Who may keep an inn.
2. The duty of an innkeeper.
3. His responsibility to his guest, in case of injury or loss.
4. His remedy against his guest.

1. *Who may keep an inn.* — Inns were instituted for the lodging and relief of travellers: every inn is not an alehouse, nor is an alehouse an inn; but if an innkeeper sells ale in common, it is then also an alehouse; and if an alehouse lodges and maintains travellers, it is then also an inn.

And no publican can sell ale or beer by retail, or cider, or perry, to be consumed in his house, without first having obtained a license from two justices, and another from the commissioners of excise, 48 Geo. 3. c. 143. But the executors, assigns, &c. of publicans, can continue to sell without fresh license, by 53 Geo. 3. c. 103. with certain qualifications. See 1 *Dick. Pract. Expos.* 5.

Any person who makes it his business to entertain passengers and travellers, and provide lodgings and necessities for them, and for their horses and attendants, is a common innkeeper, and it is not material whether there be any sign at his door or not. 1 *Haw. c.* 78.

Innkeepers are distinguished from other traders, inasmuch as that by buying and selling victuals, &c. for his guests, he cannot, as such, be a bankrupt, unless also he makes a profit of buying, beyond the necessary consumption of his guests.

2. *Duty of innkeepers.* — The duty of an innkeeper consists chiefly in harbouring and entertaining travellers, finding them proper victuals and lodgings; and securing the goods and effects of his guests; if, therefore, he refuse either lodging, drink, or food, payment for the same being tendered, he will be liable to an action; for, putting out his sign is an implied contract with the public at large, that he will find these articles.

Soldiers billeted are considered as guests.

If an innkeeper, or his servant, sell bad wine or victuals to his guest, an action may be brought against either the master or the servant.

Innkeepers, or persons keeping livery-stables, are compelled to receive a horse, although the owner is not a guest by sleeping in the house.

3. *Responsibility of an innkeeper in case of injury or loss.* — Innkeepers are responsible for the goods of their guests, which are stolen or lost out of their inns, the persons remaining guests, and the property within the custody of the innkeeper; but if a person come to an innkeeper, and desire to be entertained by him, which the innkeeper refuses, on account of his house being already full, whereupon the party says he will shift among the rest of the guests, and is there

robbed, the innkeeper will be in this case exonerated : so also, if the guest were robbed by his servant, or any other person whom he desires may be lodged with him, he shall have no action against the innkeeper.

The innkeeper is liable, although the guest does not acquaint him what goods, &c. he has, but he will not be answerable for any thing stolen from any person who was not actually his guest at the time of the theft ; and if, upon any special agreement, a man boards or lodges at an inn, the innkeeper will not be responsible for any losses, nor if the guest deliver goods upon another account.

Such is the general law respecting the liability of an innkeeper ; but he may be discharged of it under the enumerated, and some few other, special circumstances. *Burgess v. Clements.* 4 M. & S. Rep. 306. and 5 Dick. Pract. Expos. 11.

Remedy of an innkeeper against his guest.—An innkeeper may detain the person of the guest, or his horse, till payment.

By the customs of London and Exeter, if a man commit a horse to any hostler, and he eat out the price of his head, the hostler may take him as his own, upon the reasonable appraisement of four of his neighbours ; but the innkeeper has no power to sell the horse, by the general custom of the whole kingdom.

And, although an innkeeper in London has power to sell the horse of his guest for his keep, he cannot justify the taking him to himself at the price agreed upon.

The custom of London, to stop, and sell, horses for their meat, is only that the same horse may be sold for the keep of that particular horse, and not other horses belonging to the same owner.

A horse committed to an innkeeper cannot be detained for the meat of the guest.

Innkeepers, alehouse-keepers, sutlers, who, in giving any account or reckoning, in writing or otherwise, shall refuse to give in the particular number of quarts or pints, or shall sell in measures unmarked, shall not detain any goods or other things belonging to the person from whom such reckoning shall be due, but be left to his action for recovery of the same.

Publicans are bound to receive officers and soldiers billeted upon them by justices and magistrates, and the terms on which they are compellable to entertain them are provided for by the annual mutiny act, or some other statute supplementary thereto.

The last statute, which regulates the licenses of publicans, is 56 Geo. 3. c. 113.

PUDDENING, in a ship, is a thick wreath, or circle of cordage, fastened about the masts, to prevent their yards from falling, when the ropes by which they are suspended are destroyed, in battle, or otherwise.

PUDDY, a measure by which oil is sold in Madras.

PUGIL, in pharmacy, such a quantity of

flowers, seeds, or the like, as may be taken up between the thumb and the two fore-fingers. It is esteemed to be the eighth part of a manipule or handful.

PUMICE-STONE. (GER. *Bimstein*. Du. *Puim*, *Puimsteen*. DA. *Pimpsteen*, *Bimsteen*. Sw. *Pimsten*, *Klasten*. FR. *Pierre ponce*. IT. *Pietra pomice*. SP. *Piedra pomez*. PORT. *Pedra pomez*. RUS. *Penza*. POL. *Zuzel Kamienna*. LAT. *Pumer*.) This seems rather a volcanic ejection, than a volcanic product ; its colour is grey, white, reddish-brown, or black ; it is hard, rough, and porous, and consists of slender fibres parallel to each other ; very light, for it swims on water, and difficultly gives fire with steel. The whitest pumice-stone is the lightest. There is a kind, however, that sinks in water, and is much used in Naples and Sicily in building arches ; and a still more compact and heavy kind, that is easy to cut, and employed for corner-stones of buildings, as well as for walls in general.

The common pumice-stone described above, is the only kind constituting an article of commerce between the Mediterranean and this country. The greatest quantity of pumice to be met with any where is in the Campo Bianco, in the island of Lipari, a mountain about a quarter of a mile in breadth. The rock also upon which the castle of Lipari is built, is an immense heap of lava, glass, and pumice-stones ; which latter, in fact, are nothing else but an imperfect glass, or volcanic ejection, which, if exposed to a considerable degree of heat might be converted into a vitreous mass. Small quantities of pumice-stone are found also in the Arso, in the island of Ischia. But a place in Europe, which in the abundance of its pumices can equal, or perhaps surpass Lipari, is the island of Santorine, in the Archipelago, almost covered with pumice-stone. Many eruptions of pumices are in the Phlegrean Field ; one of which overwhelmed the unfortunate town of Pompeii.

The lighter sort of pumice-stone is used for smoothing the surface of metals, wood, paste-board, and stone ; for which it is well qualified by reason of its harsh and brittle texture.

Pumice-stone is likewise said to form an excellent glaze for pottery, which contains nothing noxious, and is not affected by any known menstruum.

It has been asserted, that there is a large quantity of pumice-stone on Cader Idris, in Merionethshire.

PUMP, an hydraulic machine for raising water by means of the pressure of the atmosphere. Common as it is, and overlooked by the curious, the pump must be considered a very abstruse and refined invention. There are two sorts of pumps which essentially differ ; and all the varieties are but modifications of these. One has a piston with a

perforation and valve; the other has a solid piston: the former is called the common sucking pump; the latter, the forcing pump.

The following are descriptions of the pumps most celebrated for their utility, and as such are most generally used.

The Common Sucking-Pump.

The barrel or body is a cylinder of cast iron, bored smooth within-side; it has a flanch at the top by which it is screwed to a wooden cistern that conveys the water away from the pump. It has also a flanch at its lower end, to screw on a pipe, which brings the water to the pump. In the same flanch is a pair of valves, and there is a bucket or piston which slides up and down within the barrel or body, with a similar pair of valves in it. This bucket is screwed to an iron rod, which rises towards the top of the pump and is moved up and down by means of some machine, usually termed the handle of the pump. When the bucket descends, its valves open upwards, and allow the water which fills the barrel to pass through them. When the bucket arrives at the bottom of the barrel, it is drawn up again; and as the valves shut, and prevent the water from returning through the bucket, it lifts all the water contained in the barrel into the cistern placed at top, at the same time the bucket, in rising, makes a vacuum beneath it: the pressure of the atmosphere upon the surface of the water in the well, causes it to mount up through the pipe, situated at bottom of the barrel, open the valves of the barrel, and fill the space left unoccupied by the ascent of the bucket. When the bucket begins to descend, the column of water beneath it descends also, till it is stopped by the shutting of the barrel's valves; and the valves of the bucket being by this time open, allow the water to pass through as before.

The Forcing-Pump.

In this the barrel or body is screwed upon a square box, which has a pair of valves at the top of the pipe, (whereby the water is conveyed to the barrel,) and another similar pair at the lower end of another pipe which is attached to, and rises from the square box, in a direct line with the grand barrel. The plunger, which descends in the midst of the barrel, is solid: when it is drawn up it makes a vacuum in the barrel, and draws the water up through the valves of the water-conveying pipe, from the well, to fill the barrel. The plunger is then forced down, the valves of the water-conveying pipe shut, and as the element has no other way out of the square box, it passes through the valves attached to the adjacent pipe, and rushes up the latter. The plunger is then drawn up, the valves of the adjacent pipe shut, whilst the valves of the water-conducting pipe open and supply the barrels as before.

The Lifting-Pump.

In this there are two barrels, an upper, and a lower one. The lower barrel is screwed by its top to the upper barrel, (which is the shortest of the two,) and from the side of which a crooked pipe proceeds. A cover is screwed over the top of the upper barrel, with a stuffing-box in the middle of it, which is a box containing cotton or other light substances, through which a piston-rod passes. The piston attached to the bottom part of the rod has two valves, similar to those of the sucking-pump's piston-valve; and at the bottom of the barrel are two valves similar to the flanch valves in the sucking-pump. When the piston descends, the lower valves prevent the water from going out of the barrel; and the piston-valves open to let the water press through them. When the piston returns, the valves in it shut, and it raises the water through the crooked pipe; the stuffing-box preventing its getting out at the top of the barrel; and at the same time by making a vacuum beneath it, filling the barrel through the valves in the same manner as the sucking-pump. The piston then descends, the lower valves shut, and the piston-valves open as before.

In all the pumps we have described, there is a hole at the bottom of the barrel, to get at the valves to repair them; and when the pump is at work, a cover is screwed over this hole. Pumps made upon the above construction, are seldom less than one, or two, feet in the bore of the barrel. The common sucking-pump, may, by a small addition, be converted into a lifting-pump, fitted for propelling the water to any distance, and with any degree of velocity.

The chain-pump consists of two square or cylindrical barrels, through which a chain passes, having a great number of flat pistons, or valves, fixed upon it at proper distances. This chain passes round a kind of wheel-work, fixed at one end of the machine. The teeth of this are so contrived as to receive one-half of the flat pistons which go free of the sides of the barrel by near a quarter of an inch, and let them fold in, and they take hold of the links as they rise. A whole row of the pistons, which go free of the sides of the barrel by near a quarter of an inch, are always lifting when the pump is at work; and as this machine is generally worked with briskness, they bring up a full bore of water in the pump. It is wrought either by one or two handles, according to the labour required.

The many fatal accidents which happen to ships from the choking of their pumps, makes it an important object in naval affairs, to find some machine for freeing ships from water, not liable to so dangerous a defect. The chain-pump being found least exceptionable in this respect, was adopted in the British navy; but the chain-pump itself is not free from imperfections. If the valves

are not well fitted to the cylinder through which they move, much water will fall back ; if they are well fitted, the friction of many valves must be considerable, besides the friction of the chain round the sprocket-wheels, and that of the wheels themselves. To which may be added, the great wear of leathers, and the disadvantage which attends the surging and breaking of the chain. The preference, therefore, which has been given to chain-pumps over those which work by the pressure of the atmosphere, must have arisen from one circumstance, that they have been found less liable to choke.

In point of friction, of coolness, and of cheapness, the sucking-pump has so evidently the advantage over the chain-pump, that it will not fail to gain the preference, whenever it shall be no longer liable to be choked with gravel and with chips.

Buchanan's pump, which, like the common pump, acts by the pressure of the atmosphere, is not liable to the defects incident to other pumps upon that principle, being essentially different from any now in use.

The principal object of its invention was to remove the imperfection of its choking. In attaining this important end, a variety of collateral advantages have also been produced, which enhance its utility.

The points in which it differs essentially from the common pump, and by which it excels, are, that it discharges the water below the piston, and has its valves lying near each other.

The advantages of this arrangement are, that the sand or other matter which may be in the water, is discharged without injuring the barrel or the piston-leathers ; by that means avoiding unnecessary wear and tear.

But this pump is not confined to nautical uses alone ; its adaption extends to the raising of water in all situations, and with peculiar advantage where it happens to be mixed with sand or substances which destroy other pumps, as, for instance, in alum-works, in mines, in quarries, or in the clearing of foundations ; and in its double capacity it will be very convenient in gardens, bleaching-grounds, in stable and farm-yards, and in all manufactories, or other places, where there is a necessity for raising water, and the risk of fire.

With all these advantages, it is a simple and durable pump, and may be made either of metal or wood at a moderate expense.

Such then being the pumps in general use, and all the others only varieties of these, sufficient may have been said on the subject for a merely elementary work ; and with the exception of a short account of one of them, viz. the celebrated Mr. Bolton's apparatus for raising water, we shall refer the enquirer after more minute and scientific information to books specifically dedicated to the consideration of hydraulic experi-

ments. The principle of action in Mr. Bolton's apparatus for raising water, may be illustrated in the following manner :

A horizontal pipe is formed of iron or any other substance sufficiently strong, expanding at one end like the mouth of a trumpet, and at the other furnished with a valve that may be opened or shut at pleasure : near this smaller extremity is let in a vertical pipe, at right angles to the horizontal one, furnished at the juncture with a valve opening upwards, and open at the other end. This machine is let down into a stream of water, so deep as to cover the horizontal pipe, the trumpet-like mouth of which is placed so as to meet the current : in this situation, the valve being open, a current passes through the pipe, of equal velocity with the current of the stream ; if the valve is then suddenly closed, the recoil of the current will force open the valve of the vertical pipe, through which will rush a column of water : the force of the recoil soon subsiding, the vertical column will press on the valve at its bottom, and cause it to close the end of the vertical pipe, in which the ascending column of water will be detained.

The horizontal valve being then opened, the current will recommence through the horizontal pipe, and upon closing the valve a recoil will happen as before, and an additional quantity of water will rise in the vertical pipe : by a repetition of the above process, the water rising through the pipe will overflow into any vessel placed to receive the water, forming a perpetual pump. The contrivances by which this instrument is made to draw water, from a depth below that of the impelling current, and to raise it to any height, will be mentioned hereafter. The uses to which this engine may be applied, are various : besides the raising of water for the use of brewers, &c. it may be employed in raising water from the sea for salt-works, in draining marshes and pumping ships, and supplying with water those canals that are carried over, or by the side of rivers.

For the more clear description of this invention, it is proper to state its physical principle of action, as follows :

First, when water moves or runs through a pipe, or close channel, or tube, if the end at which the water issues is suddenly stopped, the water will (by its acquired motion, momentum or impetus) act upon the sides or circumference of the pipe ; which being supposed strong enough to resist that impetus, the water will issue, with violence or velocity, at any aperture which may exist in or near the shut-end of the pipe ; and if to that aperture an ascending pipe is joined, a portion of water will rise in it.

Secondly, if a pipe open at both ends, with an ascending pipe, such as has been described, is moved along, through standing water, in the direction of its length ; upon

shutting the hinder part of the pipe, a portion of the water will rise in the ascending-pipe, in the manner which has been stated in the former case, because the water is relatively in motion in respect to the pipe.

Thirdly, if in either of the cases recited, a pipe communicating with water at any lower level is joined to the main pipe, at or near the end at which water enters into it; and if, when such water has acquired motion relatively to that pipe, by the pipe being put in motion, the mouth or end at which the water enters is suddenly shut; the water, continuing its motion relatively to the pipe, will draw or suck up water from the lower level, through the ascending pipe, in order to fill up the vacuity occasioned by the water in the main pipes, persevering in its previous motion. What has been said respecting water, is also true in respect to other fluids.

The apparatus continues its own action when once set going, unless some accident should stop, or derange, it; and is capable of raising water in great quantities, and to great heights; and they also differ in other respects from any thing which has been executed hitherto.

The nature of the said improved invention consists in using valves, of various constructions, instead of cocks to open, or shut, the end or ends of a main pipe: and in the application of mechanism, or contrivances to assist in opening, and shutting, the valves at proper times; whereby water is raised independently of any other power than a current water through the main pipe.

PUNCH, a pointed instrument, or species of stabbing awl, which, driven with a smart blow, perforates bodies. The punch is principally used in giving vent to casks, &c. containing liquids.

PUNCHEON, a little block or piece of steel, on one end whereof is some figure, letter, or mark, engraved either in creux, or relieve, impressions of which are taken on metal, or some other matter, by striking it with a hammer on the end not engraved. There are various kinds of these puncheons used in the mechanical arts; such for instance are those of goldsmiths, cutlers, pewterers, &c. See also **COINING**.

PUNCHEON, in carpentry, is a piece of timber placed upright between two posts, whose bearing is too great, serving, together with them, to sustain some large weights. This term is also used for a piece of timber raised upright, under the ridge of a building, wherein the little forces, &c. are jointed.

Puncheon is also used for the arbor, or principal part of a machine, whereon it turns vertically, as that of a crane, &c.

PUNCHEON, a measure for liquids, containing a hogshead and one third, or eighty-four gallons.

PURCHASE, in the sea-language, is the same as draw in: thus, when they say,

“the capstan purchases apace,” they mean it draws in the cable apace.

PURCHASE and SALE. See **SALE**.

PURL, (GER. *Kantiljen*. DU. *Kantiljos*. DA. and Sw. *Cantiller*. FR. *Canetilles*. IT. *Canutiglie*. SP. *Canutillos*. PORT. *Canutilhos*.) is small bits of gold or silver wire, whether real or fictitious, turned or twisted upon a long iron-needle, by means of a spinning-wheel, in such a manner that the wire takes the form of an extremely compact and thin gun-worm. Purl is employed by embroiderers in the decoration of ladies' garments, clerical vestments, liveries of gentlemen's servants, &c. &c.

It is also used for a bitter malt liquor resembling porter, much drank in London by porters and coal-heavers, under a notion of its being more invigorating than other sorts of beer.

PURLINS, in building, those pieces of timber that lie across the rafters on the inside, to keep them from sinking in the middle of their length.

PURPLE, a colour composed of a mixture of red, and blue. A beautiful transparent purple for painting may be made by boiling four ounces of Brazil wood in a pint of stale beer, and half an ounce of logwood, till the liquor is heightened to the colour you desire, which may be ascertained by dipping a piece of paper in it. If you find it too red, add a quarter of an ounce more of logwood, which will increase its purple colour, and by this method you may bring it to any degree of purple, by putting either more, or less, logwood to the former composition, and fixing it with alum. This will produce such a clear purple as no mixture of reds and blues will produce. Madame Mariana of Amsterdam, famous for painting in miniature, and for her excellent manner of illuminating prints, says, that the best purple that can be made, may be composed between the carmine and indigo; to strengthen which on the red side, you may add lake between the lighter and darker part: and lake, when it is used in the same way on the foregoing purple, produces a very fine effect. See **DYEING**.

PURSER, an officer on board king's ships, East Indians, &c. who is entrusted and charged with the provisions, beer, water, casks, &c. of the ship, and all the stores thereto belonging. He is to see the provisions received on board, and stowed carefully, the men served their daily allowance, and the oldest provisions expended first; and is accountable to the government for any part of the provisions, or stores, that shall be lost through his neglect or ill conduct. He is to provide the ship with coals, wood, turnery-ware, candles, lanterns, &c. He likewise is charged with the clothes and effects of persons who die on board; and he sells the same at the mast-head to the rest of the crew, and is obliged to give a satis-

factory account of the same to the executors. He is to keep a regular muster-book for the slop-clothes, sea-victualling, short allowance, &c. the men have been supplied with. He may sell tobacco to the seamen, not exceeding two pounds per month to a man, at the rate settled by the navy-board. He is to keep a sick-book for those sent out of the ship; and is to pass his account within six months after the ship is paid off, at farthest, &c.

PUTCHOCK, *Costus Indicus*. See **COSTUS**.

PUTLOGS, or **PUTLOCKS**, in building, are short pieces of timber about seven feet long, used in building scaffolds. They lie at right angles to the wall, with one of their ends resting upon it, and the other upon the poles which lie parallel to the side of the wall of the building.

PUTTY. When tin is melted in an open vessel, its surface soon becomes covered with a grey powder, which is an oxide of the metal. If the heat be continued, the colour of the powder gradually changes, and at last becomes yellow. In this state, it is known by the name of putty, and employed in polishing glass and other hard substances.

Putty is also a kind of paste compounded of whiting and linseed oil, worked together to the consistence of a thick dough. It is used by glaziers for fastening in the squares of glass in sash-windows, and by painters for stopping up the crevices and clefts in timber and wainscots, &c. This, when gotten too hard, as in old glass frames, may be softened by exposure to heat, and thus the old glass may be easily and safely taken out.

PUZZULANA, or **PUZZOLANA**. See **POZZOLANA** and **STUCCO**.

PYRITES, a genus of inflammable substances, composed of sulphur, which has dissolved, or saturated itself with, metals. Thus there are many kinds of pyrites; as of gold, arsenic, iron, &c. It is also the principal ore of sulphur; particularly that called arsenical pyrites, copperas-stone, or marcasite. This is very common, containing a quantity of sulphur in proportion to the iron; and, when thoroughly inflamed, burns by itself. It is either of a compact texture, steel-grained, coarse-grained, or crystallized. In this last form, it shoots mostly into cube and octahedral figures, though it is met with also in innumerable other forms. The liver-coloured marcasite has an appearance between that of the preceding, and the blue copper ore. The iron predominates in this kind, so that it is less fit than the other for extracting sulphur for it, or for the smelting of copper ores. It is formed of a compact texture, coarse-grained, and steel-grained.

PYROMETER is a machine for measuring the alteration in the dimension of metals, and other solid bodies, arising from heat. By means of this instrument, it has been discovered, that the expansion of

bars of different metals, of equal dimensions, placed in the same degree of heat, are nearly as follow: Gold, 75; silver, 105; brass, 95; copper, 89; iron, 60; steel, 56; lead, 149.

The results to be ascertained by this machine have been considered of so much importance by philosophers, that the construction, and application, of it has attracted the attention of a very considerable number of them. For further information on the subject, however, a minute discussion of it not coming within our immediate purpose here, we must refer the reader to the *Phil. Trans.* vol. *xlvi*. p. 419 and 546.

PYROPS, a mineral found in Bohemia, which was formerly distinguished by the name of Bohemian garnet. It is never found crystallized, but only in round, or angular, fragments, usually small. Colour deep red, which passes to orange, when the mineral is exposed to the sun.

PYROPHORUS. By this name is denoted an artificial product, which takes fire or becomes ignited on exposure to the air. Hence, in the German language, it has obtained the name of *luft-zunder*, or air-tinder. It is prepared from alum by calcination, with the addition of various inflammable substances. Homberg was the first that obtained it, which he did accidentally in the year 1680, from a mixture of human excrement and alum, upon which he was operating by fire, endeavouring to extract, by distillation, from human excrement, an oil, that should transmute mercury into silver; in this attempt, however, he was disappointed, as might be expected.

The preparation is managed in the following manner: Three parts of alum are mixed with from two, to three, parts of honey, or sugar; and this mixture is dried over the fire in a glazed bowl, or an iron pan, diligently stirring it all the while with an iron spatula. At first this mixture melts, but by degrees it becomes thicker, swells up, and at last runs into small dry lumps. These are triturated to powder, and once more roasted over the fire, till there is not the least moisture remaining in them, and the operator is well assured that it can liquify no more: the mass now looks like a blackish powder of charcoal. For the sake of avoiding the previous above-mentioned operation, from four, to five, parts of burned alum may be mixed directly with two of charcoal powdered. This powder is poured into a phial or matrass, with a neck about six inches long. The phial, which, however, must be filled three quarters full only, is then put into a crucible, the bottom of which is covered with sand, and so much sand is put round the former, that the upper part of its body also is covered with it to the height of an inch; upon this the crucible, with the phial, is put into the furnace, and surrounded with red-hot coals. The

fire, being now gradually increased till the phial becomes red-hot, is kept up for the space of about a quarter of an hour, or till a black smoke ceases to issue from the mouth of the phial, and instead of this, a sulphureous vapour exhales, which commonly takes fire. The fire is kept up till the blue sulphureous flame is no longer to be seen; upon this the calcination must be put an end to, and the phial closed for a short time with a stopper of clay or loam. But as soon as the vessel is become so cool as to be capable of being held in the hand, the phial is taken out of the sand, and the powder contained in it transferred as fast as possible from the phial into a dry and stout glass made warm, which must be secured with a glass stopper.

Very good pyrophorus may be made by simply mixing three parts of alum with one of wheat-flour, and calcining them in a common phial till the blue flame disappears. It is to be kept in the phial, well stopped with a good cork, when cold.

If this powder be exposed to the atmosphere, the sulphuret attracts moisture from

the air, and generates sufficient heat to kindle the carbonaceous matter mingled with it.

PYROTECNICS, the art of making fire-works. In this art the chief objects are to produce a stream of fire, or an explosion. Gunpowder, included in a strong paper implement, affords the latter effect; the fiery stream is produced by mixing the ingredients of gunpowder together in different proportions, and pulverizing them without wetting. These burn more slowly than grained gunpowder. A sky-rocket is formed by ramming this composition into a paper tube, to which an arrow or tail is connected. The explosive stream gives the rocket a progressive motion by its reaction. Rockets are sometimes used in war; but as they are most commonly exhibited for mere amusement, it is usual to include gunpowder in the head of the rocket with balls of a still more slowly burning compound, with additions to vary the colour they exhibit at the instant of the explosion, and for a few seconds afterward. See title **FIRE**.

Lights are also made for signals and station-marks, by means of rockets.

Q U A

Q, the sixteenth letter of our alphabet. As a numeral, it stands for 500; and with a dash over it, thus $\overline{q}$, for 500,000. When used as an abbreviature, *q* signifies quantity, or *quantum*; thus among physicians, *q. pl.* is *quantum placet*, i. e. as much as you please of a thing; and *q. s.* *quantum sufficit*, i. e. as much as is necessary.

QUADRANT, in geometry, is either the quarter or fourth part of a circle, or the fourth part of its circumference; the arch of which, therefore, contains 90 degrees.

QUADRANT also denotes a mathematical instrument, of great use in astronomy and navigation, for taking the altitudes of the sun and stars, as also taking angles in surveying heights and distances, &c. This instrument is variously contrived, and furnished with different apparatus, according to the various uses it is intended for; but they have all this in common, that they consist of the quarter of a circle, whose limb or arch is divided into 90 degrees; and also have generally a plummet suspended from the centre, and are furnished with *sight-vanes* or *pin-nules*, through which to look at distant objects. An enquiry into the antiquity and origin of these instruments in their first simple construction, as well as any historical account of their progressive improvements in early times, would be misplaced here.

Q U A

Suffice it, therefore, to say, that quadrants are, in the first place, as it were, *generally* divisible into two kinds, viz. *surveying*, and *astronomical*; and that they are further divisible *specifically* to an extent that it is incompatible with our limits to pursue. The first-mentioned *generic* division, *surveying* quadrants, we shall almost pass over, as properly belonging to a science foreign to commercial investigation, and shall only observe respecting *them*, that they are used in different situations and under different circumstances, according to the dimensions to be taken. To ascertain heights and depths, the plane must be disposed at right angles to the horizon; to take horizontal distances, must be disposed parallel to it. For further information on this division of the general subject, we must refer the enquirer to the articles **ALTITUDE**, and **THEODOLITE**, in books dedicated to the investigation of general science.

Astronomical quadrants, necessary for navigation, we must divide into two *specific* classes, viz. those which measure altitudes by *direct* vision, and those which determine measurements in all directions, vertical and horizontal, by *reflection*. The former are sufficient for astronomical observation, when the instrument can be kept steady in a fixed position, as on land; the latter are better suited to navigation, where the motion of

the vessel inevitably interferes with the steadiness of position of any instrument.

The simple astronomical quadrant then is usually made of brass, having its limb divided into degrees, minutes, and even sometimes into seconds; with plain *sights* fixed to one side of it; or instead thereof, a telescope, and an index moving about the centre. This apparatus is fixed on a pedestal, and by means of wheels, the periphery of one of which is cut into teeth, may be fixed to any point. By this contrivance, celestial phenomena are observable.

Towards the close of the 16th century, the first great improvement in these instruments was suggested by a Captain Davis, which obtained, by way of commerce, the appellation of the *English* quadrant, or *back-staff*. This instrument dispensed with the plumb-line, and was therefore better adapted to nautical purposes. This was soon improved upon by other persons, whose names are recorded in the annals of astronomical science, Elton, Gunter, and others.

Mural quadrants seem to have been the next great improvement, and were brought into reputation in the reign of our George I. by Graham, one being erected at Greenwich, by the direction of the king, for the use of the celebrated astronomer Halley.

Portable quadrants are a distinguished amelioration of the former invention; and this we owe to Ramsden, of very modern times.

We have gone rapidly through our notice of those varieties of the instrument under consideration, in order to conclude with a somewhat more distinct recognition of that particular one, which is more immediately within our sphere of remark.

Reflecting quadrant. This instrument, which it is almost superfluous, after giving its appellation, to say, is for the purpose of measuring altitudes and distances by *reflection*, has been assigned, in its different stages of improvement, to Sir Isaac Newton, to Dr. Halley, and to Mr. Hadley, some time president of the Royal Society. These claims it is not our purpose to adjust; certain, however, it is, that Hadley's quadrant or sextant, or octant, as it should now, according to its present construction, be called, is that most generally in use. It consists of an arch, which is the eighth part of a circle or index, a speculum, and two horizontal glasses, two skreens, and two sight-vanes.

The speculum is a piece of flat glass quicksilvered on one side, and set in a brass box, with the surface of the speculum perpendicular to the plane of the instrument, against whose centre stands the middle of the glass, its surface coinciding with the middle line of the index. The speculum receives the rays from the object to be observed, and reflects them on the horizon glasses, which are small pieces of mirror turned obliquely to the speculum, and placed

on one of the radii. The glass nearest to the centre has only its lower part quicksilvered, and set in brass; the upper part being left transparent, to see the horizon through it. In the middle of the other, or more distantly removed from the centre glass, is left a transparent slip, through which the horizon is to be seen.

The skreens are two pieces of coloured glass set in frames, and are designed to prevent the rays of the sun from injuring the eyes of the observer, and are to be placed in different positions, according to the use to be made of the instrument; impracticable to be made intelligible but by actual inspection of the instrument itself. If the different parts, of which this complicated reflecting machine is composed, be perfect, and they be properly adjusted at the time of using them, both *fore*, and *back*, observations may be made with accuracy, and with reciprocal conformation; inasmuch, that notwithstanding the continual motion of a ship in a rough sea, all sorts of angles may be measured, to enable the mariner to ascertain his latitude, time, and longitude.

QUADRUPLE particularly denotes a gold coin, as the quadruple of the Spanish pistole is a piece of four pistoles, worth about 3*l.* 12*s.* sterling, called also *double doubloon*.

QUAKERS. By stat. 7 & 8 Will. 3. c. 27., and 8 Geo. 1. c. 6. quakers making and subscribing the declaration of fidelity mentioned in 1 Will. and Mar. shall not be liable to the penalty against others refusing to take such oaths: and not subscribing the declaration of fidelity, &c. they are disabled to vote at the election of members of parliament.

By 7 and 8 Will. 3. c. 34., made perpetual by 1 Geo. 1. c. 6. quakers, where an oath is required, are permitted to make a solemn affirmation or declaration of the truth of any fact; but they are not capable of being witnesses in any criminal cause, serving on juries, or bearing any office or place of profit under government, unless they are sworn like protestants, &c.; but this clause does not extend to the freedom of a corporation. 1 *Lord Raym.* 337.

By stat. 22 Geo. 2. c. 46. an affirmation shall be allowed in all cases (except criminal) where, by an act of parliament, an oath is required, though no provision is therein made for admitting a quaker to make his affirmation. Convicted of a wilful, false, and corrupt affirmation or declaration, quakers are to suffer as for wilful and corrupt perjury. 7 & 8 Will. 3. c. 34. s. 5.

QUANTUM VALEBANT, is where goods and wares sold are delivered by a tradesman at no certain price, or to be paid for according to the general estimation of the articles; then *quantum valebant* lies, and the plaintiff is to aver them to be worth so much. The same rule is applicable where the law obliges one to furnish another

with goods or provision, as an innkeeper his guests, &c.

QUARANTINE, is the space of forty days, wherein any person, coming from abroad infected, or supposed to be infected, with the plague, is not permitted to land, or come on shore, until so many days are expired.

The prevalence of many infectious disorders, of late years, in foreign countries, and the consequent increase of the danger of their importation in articles of merchandise, have drawn the attention of the legislature to means of prevention. To this end it appeared necessary to establish a more extensive system of quarantine; and accordingly, new regulations, more connected, extensive, and more effectual, are instituted by 45 Geo. 3. c. 10. and 46 Geo. 3. c. 98. 51 Geo. 3. c. 46.

These statutes, as well as some further regulations by orders in council authorized by them to be made, we give in a less abridged state than our limits usually admit with respect to statutes, 1st, on account of their universal applicability to all persons concerned in foreign commerce; 2dly, on account of the extreme severity of the penalties; 3dly, on account of many of those penalties being personal, even to the forfeiture of life, not merely pecuniary. The 45 Geo. 3. empowers the lords of the treasury to erect a lazaret upon Chetney Hill, in Kent; and repeals all former acts respecting quarantine. It enacts, that from the 5th of April, 1805, the owners of ships which shall have performed quarantine, shall pay certain duties of customs. (*See App.*) But the treasury may order the duties to be reduced, and afterwards raised again.

No vessel, upon which the quarantine duty is imposed, shall be cleared inwards, in any port of Great Britain, the islands of Guernsey, Jersey, Alderney, Sark, or Man, unless it be first paid; and the tonnage is to be ascertained according to the register under 26 Geo. 3. c. 60.

The owners of vessels, who have paid the quarantine duties, may demand from importers a proportion of those duties.

The duties are to be paid into the exchequer.

Any goods or ships that shall be specified by the orders of his majesty, his heirs, or successors, in council, as arriving from any place whatever under suspicious circumstances of infection, shall be subject and liable to such regulations and restrictions as may be directed respecting the same in the orders of council; as also any ships, vessels, and boats, which may have received any person, merchandise, article, &c. from on board of them; and

The privy council, on emergencies, can make such regulations as may to them appear requisite. 1 to 12.

If the plague, or other infectious distemper, shall appear on board any vessel *within* the Straits of Gibraltar, the master

shall immediately proceed to the lazaret there: but, if such plague or other infectious distemper, shall appear on board any vessel *without* the Straits of Gibraltar, then the master shall proceed to the same, for the due performance of quarantine, or to the harbour of Saint Helen's Pool, between the islands of Saint Helen's Tean and North Withe, being two of the islands of Scilly, or such other place as his majesty, in council, shall from time to time direct; where, being arrived, he shall immediately acquaint the principal magistrate thereof, and also some custom-house officer of some port of England near thereunto; who shall, with all possible speed, send intelligence thereof to the commissioners of the customs at London; and the said principal magistrate shall, in like manner, with all possible speed, send intelligence thereof to one of the secretaries of state, and the said vessel shall there remain until his majesty's pleasure be known; nor shall any of the crew or passengers thereof go on shore. But, if the said master or commander shall not be able to make the said island of Scilly, or other place so appointed by his majesty as aforesaid, or shall be forced to go up either of the channels, it shall not be lawful for him to enter into any port, but he shall remain in some open road, till he receive directions by some order of the privy-council, and he shall use every necessary means in his power, to prevent any of his ship's company or passengers from going out of his ship, and to avoid all intercourse with other vessels, or persons, until such master or commander shall have received such directions; and the said master, or any other person on board, who shall be disobedient herein, shall be adjudged guilty of felony, and suffer death. 15.

The commander of any vessel, liable to perform quarantine, shall, from 5th April, 1805, at all times when such vessel shall meet with any other vessel at sea, or shall be within four leagues of the coast of Great Britain or Ireland, or of Guernsey, Jersey, Alderney, Sark, or Man, hoist a signal to denote that his vessel is liable to quarantine: which signal shall be, in the day-time, (if such vessel shall have a clean bill of health) a large yellow flag of six breadths of bunting at the main-topmast head; and (if such vessel shall not have a clean bill of health) then a like yellow flag, with a circular mark or ball entirely black thereon, whose diameter shall be equal to two breadths of bunting; and, in the night-time, the signal shall, in both cases, be a large signal lantern, such as is commonly used on board king's ships, with a light at the same mast-head; and such commander shall keep such signals, respectively, hoisted during such time as the vessel shall continue within sight of such other vessel, or within four leagues of the said coasts or islands, and while so in sight, or within such distance, until such vessel

shall have arrived at the place where it is to perform quarantine, and until it shall have been legally discharged therefrom, on failure whereof, such commander shall forfeit for every such offence 200*l*. See sect. 2. of 46 Geo. 3.

And if the commander of any vessel, not liable to perform quarantine, shall hoist such yellow flag, whereby other ships may be put to the inconvenience of changing their course, such commander shall forfeit 200*l*. 14, 15.

The commander, master, &c. of any ship arriving from foreign parts, shall give to the pilot, who shall go on board, a true account of the place and places where such ship shall have loaded, and touched in the course of the voyage; and shall forfeit 200*l*. in case of misrepresentation. And if, after such vessel shall have sailed, any places where she have touched have been made liable to the performance of quarantine, then the pilot, under the penalty of 50*l*. shall give notice thereof to the commander, who shall thereupon act accordingly; and

In case any pilot shall conduct any vessel, liable to perform quarantine, into any place, which is not specially appointed for the reception of such vessels, (unless compelled by stress of weather, adverse winds, or accidents of the seas,) such pilot shall, for every such offence, forfeit 100*l*. 16, 17.

When any place shall be infected with the plague, or other infectious disease, or when any order shall be made by his Majesty in council concerning quarantine, and the prevention of infection as aforesaid, then, as often as any vessel shall attempt to enter into any place in Great Britain, Guernsey, Jersey, Alderney, Sark, or Man, (whether appointed for the performance of quarantine or not,) the principal officer of customs in such place, or such person as shall be properly authorised, shall go off to such vessel, and such officer or other person shall, at a convenient distance from such vessel, demand of the commander thereof, a true answer in writing or otherwise, upon oath or not, according as he shall, by such officer, or other person, be required, to all such questions as shall be put to him; and, if such commander shall thereupon refuse to make a true discovery in any of the particulars concerning which he shall be interrogated, he shall for every such offence, forfeit 200*l*. 18.

If it should appear that such vessel is liable to perform quarantine, and that the port where it so arrives is not the port where it ought to perform quarantine, all officers of his majesty's ships of war, forts, or garrisons, and others whom it may concern, upon notice thereof, and any other persons whom they shall call to their aid, shall oblige such vessel to repair to such places as shall be appointed for performance of quarantine. And in case any such vessel shall come from any place visited with the plague, or other in-

fectious disease, or shall have any person on board actually infected, and the commander shall conceal the same, he shall be adjudged guilty of felony, and suffer death. 19.

Every commander of any vessel ordered to perform quarantine, shall forthwith deliver to the superintendent, or other person appointed to see quarantine performed, such bill of health and manifest as he shall have received during his voyage, together with his log-book and journal, under pain of forfeiting 100*l*. if he shall wilfully refuse and neglect. 20.

If the commander of any vessel, liable to perform quarantine, having notice that such vessel is so liable, shall himself quit, or shall knowingly suffer any seamen or passengers to quit such vessel by going on shore, or by going on board any other vessel or boat, before such quarantine shall be fully performed, (unless in such cases, and by such proper licence as shall be directed concerning quarantine, and the prevention of infection, as aforesaid,) or if the commander of such vessel shall not, within a convenient time after due notice given for that purpose, cause such vessel and her lading to be conveyed into the places appointed to perform the quarantine in, then such commander, for every such offence, shall forfeit five hundred pounds. And, if any person shall so quit such vessel, contrary to the true meaning of this act, it shall be lawful for all persons whatsoever, by any kind of necessary force, to compel such person to return on board; and every such person so quitting such vessel shall, for every such offence, be imprisoned for six months, and shall also forfeit 200*l*. 21.

When any vessel, which has performed quarantine in a foreign lazaret, shall arrive in Great Britain, Guernsey, Jersey, Alderney, Sark, or Man, with a clean bill of health, no goods, or merchandise, liable to retain the infection of the plague, or other infectious disease, shall be unshipped or moved in order to be landed; but the commander of such vessel shall, immediately upon arrival, give notice thereof, and of the contents of his manifests as aforesaid, and of the foreign port in which such vessel hath performed quarantine, to the principal officer of the customs at the port of arrival, or at the port nearest thereto; and, if the commander, or any person whatsoever, shall land, unship, unload, or move in order to land, any goods, or merchandise, out of the said vessel, before an order of privy council shall be made, giving directions therein, or otherwise than shall be directed in the said order, every such person shall, for every offence, forfeit 200*l*.; and

All persons liable to perform quarantine, shall be subject, during the said quarantine, to such orders as they shall receive from the proper officers, according to such directions as shall be made by order of council; and, if

any person, so obliged to perform quarantine, or any person having had intercourse with them, shall neglect to repair within convenient time, after notice, to the said lazaret, or other place appointed, or shall escape, or attempt to escape, out of the same before quarantine duly performed, the watchmen, and other persons appointed to see quarantine performed, shall compel every such person to return; and every person so neglecting to repair into the said lazaret, or other place, and also every person actually escaping as aforesaid, shall be adjudged guilty of felony, and suffer death; and

Persons quitting any ship, or place, liable to perform quarantine, shall be open to seizure by any constable, &c. and to be conveyed, by the warrant of any justice of the peace, to the place appointed for the performance of it. 22, 23, 24.

25. Contains an indemnity for orders in council to send afloat, for the performance of quarantine, any person who has had intercourse with a suspected vessel.

Officers of customs, and others, to whom it appertains to execute orders concerning quarantine, or the prevention of infection, guilty of any wilful breach or neglect of duty, shall forfeit such office or employment, and become thenceforth incapable to hold the same; and moreover 100*l.*; and, deserting duty when employed, or permitting persons, ship, vessel, goods, or merchandise, to depart, or be conveyed out of the lazaret, &c. unless by order of council; or, being authorised to give a certificate of a ship having duly performed quarantine, knowingly giving false certificate thereof; shall be deemed guilty of felony, and suffer death; and, knowingly and wilfully damaging goods performing quarantine, be liable to pay treble damages, and full costs of suit, to the owner thereof. 26.

If any person, not infected with the plague, or other infectious disease, nor liable to perform quarantine, shall enter the said lazaret, or other place so appointed, whilst any person being under quarantine shall be therein, and shall return, or attempt to return thence (unless by license), the watchmen, &c. shall compel such person to repair into the said lazaret, there to perform quarantine; and, in case such person shall actually escape out of the said lazaret, or other place where he shall be so placed to perform quarantine, he shall be adjudged guilty of felony, and suffer death. 27.

After quarantine shall have been duly performed by any vessel or persons; and, upon proof made by the oaths of the commander of such vessel, and of two persons belonging thereto, or upon proof by the oath of two or more credible witnesses, before the collector, or principal officer, of the customs, or any justice of the peace living near the place, or (when within Guernsey, Jersey, Alderney, Sark, or Man,) before

any two jurats, or magistrates, of the said isles, that such vessel, and every such person have duly performed quarantine as aforesaid, and that the same are free from infection; and, after producing a certificate to that purpose from the chief officer who superintends the quarantine, then such collector, or principal officer, or justice of the peace, or jurats, or magistrates, are to give a certificate thereof; and thereupon such vessel, and persons so having performed quarantine, shall be liable to no farther restraint. 28.

All goods, &c. liable to quarantine, shall be opened and aired in such manner, as shall be directed by order in council; and, after such orders shall have been complied with, a certificate thereof shall be given by the chief officer appointed to superintend such quarantine, and proof thereof shall be made by the oaths of two or more credible witnesses, before the authorities last mentioned, as the case may require; and, upon the production of certificates thereof to the commissioners of customs, &c. such goods, &c. shall be forthwith discharged from any restraint or detention upon the same account; (*but see next Stat.*) and persons forging certificates &c. shall suffer death. 29, 30.

Concealing from the officers of quarantine, or clandestinely conveying letters, &c. from any ship performing, or liable to perform quarantine, or from the lazaret, felony, *sans* clergy; and unloading goods, &c. from a vessel liable to perform quarantine, and receiving such articles, a forfeiture of pounds sterling, not exceeding five (nor less than one) hundred. 31.

If it happen, that any part of Great Britain, Ireland, Guernsey, Jersey, Alderney, Sark, or Man, or France, Spain, Portugal, or the Low Countries, be infected with the plague, or any other infectious disease, his majesty, by proclamation, may prohibit all small boats and vessels, under twenty tons burthen, from sailing out of Great Britain, Guernsey, Jersey, Alderney, Sark, and Man, until security be first given by the master thereof, in the penalty of 300*l.* that such boat or vessel shall not go to, or touch at, any place mentioned in such proclamation; nor the master thereof, nor any mariner or passenger therein, shall, during such time, go on board any other ship or vessel at sea; nor shall such master suffer any person to come on board at sea from any other ship or vessel, nor shall, during the time aforesaid, receive any goods or merchandise whatsoever, out of any other ship or vessel; and every boat or vessel, for which such security shall be required, sailing before such security shall be given, shall be forfeited to his majesty; and the master, and every mariner thereof, shall severally forfeit 20*l.*; and publication in the London Gazette of any order in council, to be sufficient notice to all concerned. 32.

The 46 Geo. 3. c. 98. makes the following additional provisions:

1. Any vessel, on board whereof the plague, or an infectious distemper shall actually be, is required, when meeting with another ship within four leagues of Great Britain, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, to hoist a signal denoting its existence; in the day-time a yellow and black flag, of eight breadths of bunting at the main-mast-head; and in the night-time, two large signal lanterns (those commonly used) one over the other at the same mast-head; and such commander, master, &c. shall keep it hoisted until arrival at the port or place where the ship is to perform quarantine; under a penalty of 200*l*.

2. The commander shall deliver to the pilot coming on board, in addition to the particulars enacted by 45 Geo. 3. c. 10. a complete account of the cargo, on penalty of 200*l*. for neglect, refusal, misrepresentation, or omission thereof or therein; whereupon such pilot, under forfeit of 100*l*. shall communicate to the commander information of such of the articles as may be liable to quarantine. Such commander shall hoist a proper signal, and comply in every respect with the aforesaid recited act; and if, unless by stress of weather or other accidents, the pilot conduct the ship to the place not specially appointed for her reception, having omitted to require such account of the cargo, for each offence, 100*l*. shall be paid by him.

3. No vessel that has performed quarantine, having been solely rendered liable to it by communication, against the will of the master and crew, with a ship that was originally subject to perform it, shall be charged with the duties imposed upon the latter by the said recited act; provided such circumstance appear to the satisfaction of the commissioners of the customs.

5. So much of the recited act as relates to the certificate and proof of goods having been opened and aired, is repealed; and such proof shall be hereafter made from the oath of the master of the lazaret, and of the quarantine officers already mentioned in the aforesaid act, (or of two or more credible witnesses serving in the lazaret or vessel, before the superintendent of quarantine, or his assistant; after the administration of which oath, certificate shall be made by the officers of quarantine; on the production of which to the officers of customs, such articles, goods, &c. shall be liable to no further restraint, either at the port of quarantine, or any other place to which they may be conveyed.

6. His majesty's privy-council may order ships coming from America, or the West Indies, on apprehension of the yellow fever, &c. to come to anchor at certain places appointed from time to time by the commissioners of the customs, in order to ascertain whether or not the performance of

quarantine be necessary; which shall not, however, take place unless specially ordered afterwards.

7. All persons, ships, boats, and vessels, may be prohibited, by order in council, to go within the limits of any station assigned to ships without clean bills of health, for the performance of quarantine: and every person, for such offence, shall forfeit 500*l*.

8. Forging, altering, or uttering, knowingly and wilfully, any certificate of quarantine, shall be adjudged felony, and punished with death, without benefit of clergy.

9. Consuls and vice-consuls can administer oaths respecting quarantine, in the several places and towns where they reside.

10. Persons authorised to take examinations may administer on oath; and those who swear falsely, or procure others so to do, shall be deemed guilty of wilful and corrupt perjury.

Proclamation, dated April 5, 1805, relative to the Performance of Quarantine.

I. All vessels (not having the plague or other infectious disease, of the nature of the plague, actually on board) coming from the Mediterranean, or from the West Barbary, on the Atlantic Ocean, with clean bills of health; and all ships, vessels, or boats, receiving any person or articles from on board, before the performance of quarantine, shall comply with the directions of this act (45th Geo. 3.), or the orders in council; and all persons on board of, or communicating with such vessel thus rendered liable to quarantine, shall forthwith repair to the lazaret appointed; under penalty of subjecting themselves to all the pains and punishments of death and otherwise, which the law may, in case of non-compliance, decree.

II. All such vessels coming from the Mediterranean, or from the West Barbary, on the Atlantic Ocean, as shall arrive with clean bills of health, and all persons, goods, wares, and merchandise, on board thereof, shall perform quarantine in the places hereinafter appointed, that is to say:—

All such vessels, so arriving as last aforesaid, as shall be bound to the ports of London, Rochester, or Feversham, or other creeks or places within the said ports, shall perform quarantine in Standgate Creek; if bound to the ports of Leigh, Malden, Colchester, Harwich, Ipswich, Woodbridge, Alborough, Southwold, Yarmouth, Blackney and Clay, Wells, Lynn, Wisbeach, Boston, Grimsby, Hull, Bridlington, Scarborough, Whitby, Stockton, Sunderland, Newcastle, Berwick, or other creeks or places within the said ports respectively, they shall perform quarantine in Whitebooth Road, between Hull and Grimsby; if bound to the ports of Carlisle and Chester, or to Liverpool, Lancaster, Whitehaven, Preston, Beaumaris, or to any other creeks or places within the said ports, or to the Isle of Man,

shall perform quarantine in a place called Hoylake, near Liverpool, at the west end of Hoylake, or in Milford Haven; if bound to the ports of Sandwich, Deal, Dover, Rye, Newhaven, Shoreham, Arundel, Chichester, Portsmouth, Southampton, Cowes, or any other creeks or places within the same ports respectively, shall perform quarantine at a place called the Mother-bank, near Portsmouth; if bound to the ports of Poole, Weymouth, Lyme, Exeter, Dartmouth, Plymouth, Looe, Fowey, Falmouth, Gweek, Penryn, Truro, Penzance, Scilly, or any other creeks or places within the said ports, shall perform quarantine in a place called St. Ives' Pool, within the mouth of the harbour of Falmouth; if bound to Bridgewater, Minehead, Bristol, Gloucester, Chepstow, Swansea, or any other creeks or places within the said ports, shall perform quarantine in Kingroad and Porshute Pill; if bound to St. Ives, Padstow, Biddeford, Barnstaple, Ilfracomb, Llanely, Pembroke, Milford, Cardigan, Aberystwith, or any creeks or places within them, shall perform quarantine at Milford Haven; if bound to the islands of Jersey, Guernsey, Sark, or Alderney, or any part of them, shall perform quarantine, either (as aforesaid) at the Mother-Bank, near Portsmouth, or St. Ives' Pool, within the harbour of Falmouth; if bound to the eastern coast of Scotland, comprehending the ports of Leith, Borrowstonness, Alloa, Dunbar, Kirkcaldy, Anstruther, Preston-Pans, Dundee, Perth, Montrose, and Aberdeen, or to any member, creek, or other parts thereof, shall perform quarantine in Inverkeithing Bay; if bound to the western ports of Scotland, comprehending the ports of Port Glasgow, Greenock, Irvine, Cambeltown, Oban, Rothsay, Fort William, Air, Port Patrick, Stanraer, and Wigtoun, or to any member, creek, or other part thereof, shall perform quarantine at Holy-Loch, in the Firth of Clyde; if bound to the northern ports of Scotland, comprehending the ports of Inverness, Zetland, Orkney, Stornaway, or to any member, creek, or other parts thereof, shall perform quarantine in Cromarty Bay, in the Murray Frith; if bound to the south-west parts of Scotland, comprehending the ports of Dumfries and Kircudbright, or to any member, creek, or other parts thereof, shall perform quarantine at Carsthor, at the mouth of the river Nith; if bound to any place on the coasts of England or Scotland, not within any of the ports or limits before-mentioned or described, shall perform quarantine at such place hereinafter appointed for performance of quarantine as shall be nearest to the port or place to which such vessels respectively shall be bound.

Ships taken as prize shall perform quarantine as if belonging to the port wherein they are carried: by order in council, June, 1806.

III. All goods, wares, and merchandise,

imported in any such vessels, shall be opened and aired at the several places before respectively appointed, in the manner and for the time hereinafter directed.

IV. All such vessels, except any ship of war, transport, or other ship in the actual service of government, under a commissioned officer in the navy, not having the plague or other infectious disease of the nature of the plague actually on board, coming from the Mediterranean, or from the West Barbary, on the Atlantic Ocean, as shall not be furnished with clean bills of health, shall perform quarantine in Standgate Creek, and no where else; and, in case any vessels coming from any of the places before described, not being furnished with a clean bill of health, shall come into any of the out-ports of this kingdom, or to any of the islands aforesaid, the principal officers of the customs at such port, or in such islands, or the governor or chief magistrate thereof, shall cause such vessel to depart thence immediately, and proceed to Standgate Creek: and all his majesty's ships of war, as aforesaid, not furnished with clean bills, shall perform quarantine at the Mother Bank, in a separate and distinct place, marked out with yellow buoys: in the centre of which place, a floating lazaret, moored with chains, with a yellow flag, constantly flying at the mast-head, shall be constantly stationed; and all vessels or boats, receiving any person, or articles from on board such ships liable to quarantine, shall perform it in like manner, either at the Mother Bank or in Standgate Creek, respectively.

V. Vessels having on board any articles of the first class hereafter stated, (the produce or manufacture of Turkey, or any place in Africa within the Straits of Gibraltar, or in the West Barbary, on the Atlantic Ocean) and coming from any place in Europe without the Straits, or on the continent of America, where his majesty has declared no sufficient establishment of quarantine, together with all ships receiving any such articles from on board of them, shall perform quarantine in the manner directed to ships from or through the Mediterranean, or the West Barbary, on the Atlantic Ocean, with clean bills of health.

VI. If, either through ignorance, stress of weather, or other circumstance, a ship shall pass the port or place appointed for quarantine; on the commander, or master, or pilot, (if on board) of such vessel, making oath, that the omission was not intentional, to the satisfaction of the superintendent of quarantine, or his assistant, or the authorised officer of the customs, the ship may be permitted to proceed to any other appointed place, at the discretion of such officer of quarantine, keeping proper quarantine-signal hoisted during the whole time; and quarantine shall be performed at such substituted place as if the vessel had been thither bound.

VII. No ship or vessel liable to quarantine, unless from orders, weather, damage, loss, or accident, shall attempt to enter any port or place in Great Britain, or the islands aforesaid. The necessity shall be proved by the commander or master, to the satisfaction of the superintendent or other officer of quarantine, who will propose the quarantine questions hereinafter directed. On default of such satisfactory answers, or of compliance with the directions they may receive, such vessel shall be compelled to proceed to sea by the quarantine officers; who will, if necessary, call in the aid of other officers of any of his majesty's ships.

VIII. On any vessel attempting to enter any port or place appointed for the performance of quarantine, the officer of quarantine, or principal officer of customs, or four or more of them, authorised by commissioners, shall go off to such vessel, and keeping to windward at a convenient distance, make the following queries:

1st. What is the name of the ship, and the name of the commander or master?

2d. Are you the commander or master? Where does she belong?

3d. From whence do you come?

4th. To what place are you bound?

5th. At what ports have you touched since you left the port of your lading, on your homeward voyage?

6th. What ships have you had intercourse or communication with, on your passage, and from whence did they come?

7th. Did the plague, or any other infectious disease or distemper prevail, in any degree, at the place whence you sailed on your homeward voyage, or at any of the places at which you have touched? If at any, say at which, and 'when. Are any persons on board your ship suffering under any infectious disease, or have any persons died or been ill of a disease of that nature, in the homeward passage? And if any, what number? And if any have died or been ill of such disease, were their bedding and clothes destroyed?

(If the ship shall have sailed from any port in Europe without the Straits, or on the continent of America.)

8th. Have you on board any goods enumerated in this list?

(Handing up a list of articles enumerated in the first class.)

If you have, specify the same, and whether they are of the growth, produce, or manufacture of Turkey, or of any place in Africa within the Straits of Gibraltar, or in the West Barbary, on the Atlantic Ocean, or of what other place? Have you any declaration to prove of what place they are the growth, produce, or manufacture?

(If the ship comes from the Mediterranean, or from any other place respecting which there is any order in council in force concerning quarantine.)

9th. Have you any, and what bill of health?

10th. What number of officers, mariners, and passengers have you on board?

And such commander, master, or other person, having charge of such ship or vessel, shall, upon such demand, give a true answer to such questions in writing or otherwise, and upon oath, or not upon oath, according as he shall be required by such superintendent, or his assistant, or principal officer, or other officer of the customs, authorised as aforesaid, under such pains and penalties as are inflicted by the hereinbefore recited act.

And if it shall appear by the answer so given to the said questions that the said ship or vessel is liable to quarantine, the said commander, master, or other person having the charge or command thereof, shall be directed to repair, and shall repair, forthwith with such ship or vessel to the proper place appointed in that behalf for the performance of quarantine, and shall not be permitted to remain in, or enter into, any port or place, other than the port or place so appointed as aforesaid, unless compelled by stress of weather, damage, loss, or other injury, unavoidably occasioned to the ship or vessel by the perils of the seas; which stress of weather, damage, loss, or other injury, and that the said damage, loss, or other injury, was unavoidable, and not wilfully or intentionally done or occasioned, shall be made appear by the oath and examination of such commander or master, and of the pilot (if any) on board, to the satisfaction of the superintendent or his assistant, or of the principal or other officers of the customs, authorised as aforesaid, at the port or place in which he shall be so detained, or into which he shall be so compelled to enter as aforesaid; in default of which satisfactory proof, or when the cause of such ship or vessel so coming in as aforesaid shall no longer exist, such superintendent, assistant, principal or other officer of the customs, authorised as aforesaid, shall direct, and (if necessary) compel such ship or vessel to repair to the proper place appointed in that behalf for the performance of quarantine, and shall use all necessary means for that purpose, either by firing of guns upon such ship or vessel, or by any other kind of necessary force whatever.

IX. And it is hereby further ordered, that, on the arrival of any ship or vessel liable to quarantine, in any port or place hereby appointed for the performance of quarantine, the superintendent of quarantine, or his assistant, or in case of such superintendent and his assistant being otherwise necessarily engaged, the principal officer of his Majesty's customs at such port or place, or such officer of the customs as shall be duly authorised to act in that behalf, (together with the medical attendant, in such

cases as shall be thought to require his assistance,) shall go alongside such ship or vessel in a boat, (keeping to windward,) and shall see the officers, crew, and all other persons belonging to or being on board such ship or vessel, mustered on the gangway, and the superintendent of quarantine, or his assistant, or such principal or other officer of the customs, authorised as aforesaid, shall then and there, in the presence of the crew, put the following questions to the commander, master, or other person having charge of the ship or vessel:

1st. What is the name of the vessel, and the name of her commander or master?

2d. Are you the commander or master?

3d. To what port or place does she belong?

4th. When did you sail from the port or place whence you took on board your outward cargo, and at what places did you touch before you arrived at the port or place where you took in your present cargo?

5th. Did you carry any bill or bills of health with you to the port or place where you took in the cargo you have now on board? From what places? Were the said bills of health clean, unclean, or suspected?

6th. From what port or places does she now come? When did you sail from such port or place; and at what place or places have you touched in the course of the voyage?

7th. Have you any bill or bills of health on board? From what place or places? Are the same clean, unclean, or suspected? Produce them.

(If the ship shall have sailed from any port or place in Europe without the Straits, or on the continent of America.)

8th. Of what articles does your cargo consist? Have you on board any goods enumerated in this list?

(Handing up a list of articles enumerated in the first class.)

If you have, specify the same; and whether they are of the growth, produce, or manufacture of Turkey, or of any place in Africa, within the Straits of Gibraltar, or in the West Barbary, on the Atlantic Ocean, or of what other place. Have you any declaration to prove of what place they are the growth, produce, or manufacture?

9th. At what place or places was the cargo, or any part thereof, taken on board? On what day did you arrive at the place or places where you took in the whole, or any, and what part of the cargo? And on what day did you sail from such place or places; and what part of your cargo was taken in at each place, and when?

10th. Did the plague, or any other infectious disease or distemper, prevail in any degree at the places whence you sailed, or any of the places at which your cargo was

taken on board, or at which you touched? If at any, say at which, and when.

11th. What number of officers, mariners, passengers, or other persons have you on board? Describe the number of each.

12th. Do the said officers, mariners, passengers, and other persons consist of the same individuals as were on board at the port from which you sailed upon your homeward voyage? If any other persons have been taken on board, or if any of your officers, crew, or passengers, have quitted your ship since you sailed from such port, or before your arrival at this place, or if any other alterations in that respect have taken place, specify the same, the causes, and the time or times of such alterations.

13th. What number of persons (if any) have died on board during the voyage? When and in what part of the voyage did such person or persons die? Of what disease or distemper?

14th. In the course of your voyage have any persons on board suffered from sickness of any kind? What was the nature of such sickness? When did it prevail? How many persons were affected by it? Are there any convalescents on board? Or are all persons on board at present in good health?

15th. Were any of those who died, or who have been sick in the course of the voyage, affected, or suspected to have been affected by any infectious disease or distemper? Were the bedding and clothes of such deceased and sick persons destroyed? If so, when, and in what manner? Were any of the persons immediately employed about the sick, afterwards taken ill? If so, of what disease? and in how many days after having been so employed?

16th. At what precise time after leaving port did such deaths happen? In how many days after being indisposed did the sick die? What were the most obvious appearances of the disease?

17th. Have you spoken to, or otherwise had any communication with any vessel at sea during the voyage? What were the names of such vessels, and to what country, port, or place, did they belong? From what ports or places were they coming, or at what ports or places had they touched on their voyage, and to what country, ports, or places were they bound? What was the nature of the communication held? What do you know respecting the state of health on board such vessels?

18th. Have there been any letters, parcels, or other articles delivered out of, or received into your ship or vessel from any ship, vessel, or boat, met with on the voyage, or before or since your arrival at this place? And what were such letters, parcels, or articles? And where were the same delivered or received, and into or out of what ship, vessel, or boat?

19th. What pilots or other persons, from the shores of Great Britain, or from the islands of Scilly, Guernsey, Jersey, Alderney, Sark, or Man, have been or are now on board your ship or vessel, or have had any communication whatever with the ship's company, or any of the passengers, during the voyage homewards, or before or since your arrival at this place? If any such pilots or other persons have come on board, and have afterwards quitted your ship or vessel, specify the names of such persons, and the time, manner, and circumstances of their so quitting your ship or vessel.

20th. Did you leave any British ships or vessels at any of the ports you sailed from? if you did, mention their names, and the names of the commanders.

21st. Were such ships loading? Were they near their departure, and whither were they bound?

22d. Did you meet with any British ships or vessels at any of the places you touched at? If you did, say when, where, and what were the names and destinations of such ships or vessels, and to what ports or places did they belong.

23d. Do you know whether any foreign vessels, loading at the port from which you sailed, were bound beyond the Straits of Gibraltar? And if so, what were they, and whither were they bound?

24th. Do you know whether any person whatever, employed in loading your vessel, or in bringing any articles into it, on having any communication on board thereof, was taken ill during such employment or communication? Or whether, by the absence of such person or persons, in the course of such employment, any suspicion was entertained of their having been taken ill? If so, of what disease?

25th. Do you know whether or not your cargo, or any part thereof, had been long in warehouse before its being taken on board? If you do, say how long. Have you any knowledge of its being packed or handled on shore, or conveyed from shore, or stowed on board, by persons affected with the plague, or any other infectious disease or distemper?

26th. Did you touch at the Isle of Rhodes, the Morea, or any and what part of the coast of Africa, within or without the Mediterranean? And if so, at what time or times respectively? And had you any and what communication with the shore at those respective places? Did any person on board communicate during the voyage, in any manner whatever, with any ship or vessel coming from any of those places? if so, when, and in what manner? And what do you know of the state of health of the persons on board such ships or vessels?

X. And it is further ordered, that the answers to the aforesaid questions shall be taken down in writing; and that the com-

mander, master, or other person, having the charge of such ship or vessel, shall solemnly make oath to the truth thereof before the superintendent of quarantine, or his assistant, or the principal or other officer of the customs, authorised as aforesaid, (as the case may be,) and such superintendent of quarantine, or his assistant, or such principal or other officer of the customs as aforesaid, (with the advice of the medical attendant, if such shall be judged necessary,) shall, according to the answers returned to the questions hereinbefore set forth, then appoint a proper place or station for such commander, master, or other person, having the charge of such ship or vessel, to repair to with such ship or vessel; who thereupon shall, as soon as possible after having answered the foregoing questions, repair with such ship or vessel to such place or station, where the said ship or vessel shall be forthwith placed, and shall there perform quarantine accordingly; the said commander, or master, or other person having the charge of such ship or vessel, carrying with him the log-book, manifest, and all the ship's papers, all of which he shall there deliver to the superintendent of quarantine, or his assistant, or to the principal or other officer of the customs, authorised as aforesaid, (as the case may be,) the said log-book, manifest, and papers, having been first immersed in vinegar, and fumigated; and such commander, master, or other person having the charge of such ship or vessel, shall there solemnly make oath to the truth of the contents of such log-book, to the best of his recollection and belief, or shall state and specify upon oath in what particulars alone the same, or any part thereof, is false and incorrect, and whether every particular entry therein was made as soon after the fact as possible; and if not, for what reason it was delayed, and when it was made; and also to the truth of all the other ship's papers, before such superintendent or his assistant, or the principal or other officers of the customs, authorised as aforesaid, and shall obey and conform to all such directions as he shall then receive, touching the performance of quarantine, from such superintendent or his assistant, or the principal or other officer of the customs, authorised as aforesaid.

XI. And it is hereby further ordered, that in the case of ships or vessels liable to quarantine arriving at any of the ports of Great Britain or islands aforesaid, if any suspicious circumstances shall appear in the answers returned to the said questions by the commander or master, or other person having charge of any such ship or vessel, or from any other circumstance, the proper officer of the customs at such port or island shall immediately transmit such answers, and give notice of the cause of such suspicion to the lords of his majesty's most honourable privy council, and the commissioners of his ma-

jeaty's customs; and shall, without regard to the bill of health, whether clean or otherwise, order such ship or vessel to a station distant from all other ships or vessels in the same port or place, and put her under special guard, in order the more effectually to prevent all communication therewith.

XII. All vessels liable to quarantine as aforesaid, and being furnished with clean bills of health, as well as the crews and passengers on board the same, shall perform a quarantine of fifteen days in the manner heretofore practised, which shall commence from the time when such part of the cargo, if any, as is enumerated in the two classes hereinafter stated, shall have been delivered into the floating lazaret in Standgate Creek, or into the lazaret to be erected at Chetney Hill in case the vessel shall perform quarantine in Standgate Creek; or into lighters or other proper vessels appointed for that purpose, in case the vessel shall perform quarantine at any of the places hereinbefore appointed for the performance thereof, by ships bound to any of the out-ports or islands aforesaid: but, in cases where no part of the cargo shall consist of such goods as are last described, then such quarantine of fifteen days shall commence on the day on which the master, or other person having charge of such vessel, shall have returned on board the same.

XIII. As to all goods, wares, and merchandise coming from the Mediterranean, or from the West Barbary on the Atlantic Ocean, in vessels furnished with clean bills of health; all such goods, wares, and merchandise, (other than such as are enumerated in the first and second classes hereinafter stated,) shall be aired and treated on board the vessel in which they arrive, according to the manner heretofore practised respecting such goods imported in vessels furnished with clean bills of health, and shall continue to be so treated for one week; and all such goods, wares, and merchandise, as are enumerated in the said first and second classes hereinafter stated, coming in vessels with clean bills of health, shall be removed from the vessel to the place appointed for that purpose, and shall there be aired and treated in the manner heretofore practised with regard to such goods, wares, and merchandise, and shall continue to be so treated for fifteen days.

XIV. With respect to vessels not having the plague, or other infectious disease of the nature of the plague, actually on board, and which may arrive in any of the ports of this kingdom, or the islands aforesaid, coming from the Mediterranean, or from the West Barbary on the Atlantic Ocean, not being furnished with clean bills of health; every such vessel (having repaired to Standgate Creek as hereinbefore directed) shall perform quarantine either in the floating lazaret, there, or in the land lazaret at Chetney Hill,

and no where else, in the manner and for the time hereinafter mentioned.

XV. Immediately after the master or commander of every such vessel so arriving without a clean bill of health shall have undergone the several examinations hereinbefore directed, and shall have returned on board his vessel, two quarantine guardians shall be placed on board.

XVI. The crew or passengers on board of any such vessel under quarantine may be permitted to have communication with others by letters, under the following regulations and restrictions, viz:

In cases where such persons shall perform quarantine in the lazaret at Chetney Hill, an officer, appointed by the superintendent of quarantine, shall daily go to a proper place to be appointed for the receipt of letters from the person under quarantine; and in cases where such persons shall perform quarantine in the floating lazaret, or in a separate vessel, an office-boat, not under quarantine, with an officer appointed by the superintendent of quarantine, shall, in like manner, daily, at a fixed hour, go round the said floating lazaret or vessel, to receive such letters, the usual precaution of dipping such letters in vinegar, and putting them into the fumigating-box, being always first observed; and such letters shall remain in the fumigating-box till such time as the superintendent shall give directions for taking them out to be forwarded; and no person, except the said superintendent of quarantine, or his assistant, or one of the guardians on board the ship or vessel, shall be permitted to deliver such letters from such fumigating-box; and the said persons, so hereby authorised to deliver the same, shall take care, where several letters or papers are inclosed together, to slit open the covers in the manner practised in the lazarets of the Mediterranean.

And all letters to such persons so under quarantine shall be delivered to the superintendent or his assistant, and shall be distributed according to his directions; and no communication or conference shall be had by persons not under quarantine with persons so under quarantine, except by permission of the superintendent, or his assistant, and under such regulations and restrictions as shall be directed by the said superintendent; nor, in cases where such persons shall perform quarantine on board any ship or vessel, unless from the boat of the superintendent, or his assistant, one of whom shall always be present during such communication and conference; and such communication and conference shall be had at the distance observed by the superintendent, or his assistant, in their usual communication with ships and persons under quarantine.

XVII. And, for the purpose of preventing all clandestine communication between

the lazaret and hospital, or pest-house at Chetney-Hill, and between the floating lazaret and the hospital-ship, and vessels under quarantine, and between such vessels and the shore, a night-watch shall be regularly kept, and sufficient number of guard-boats and officers appointed; and such boats shall row guard all night, and sentinels, with loaded muskets, and with small pieces of ordnance, loaded with grape or cannister shot, shall be constantly stationed on the most commanding parts of the floating lazaret, at Standgate Creek or elsewhere, and of the lazaret at Chetney Hill; and no houses or other buildings shall be erected at or near the beach, other than those belonging to the said lazaret; and all boats belonging to any floating lazaret, when not on necessary duty, shall be always either on board the same, or fastened thereto by chains with strong padlocks, the keys of which shall be lodged in the custody of a person to be appointed for that purpose by the superintendent; and all the boats belonging to vessels in quarantine shall be taken from them, and no use made of such boats, except for the purpose of carrying goods to the lazaret, or upon occasions of necessity. And such boats shall not be delivered up to the masters of the vessels until the expiration of the quarantine to be respectively performed by them.

XVIII. The superintendent of quarantine, or some proper person appointed by him, shall, as often as required, afford assistance and provide necessaries for the persons in the lazaret at Chetney Hill, and the floating lazaret, or the hospital-ship, and also for those on board vessels under quarantine, taking care to allow of no improper communication with the persons employed for that purpose; which persons shall always place their boats to windward, and shall deliver, by means of buckets with chains, the articles supplied by them.

XIX. The quarantine guardians, placed on board vessels not furnished with clean bills of health, shall be instructed to take especial care that nothing whatever be delivered from on board such vessels, when under quarantine, without an order in writing from the superintendent or his assistant; every such order to be entered in a book by one of the said guardians, and the original to be delivered back to the superintendent or his assistant, and nothing, however little susceptible it may be thought to be of infection, shall be conveyed from one ship or vessel under quarantine to another, nor any personal intercourse be permitted from any such vessel to another; and one of the quarantine guardians, when thereto required by the superintendent of quarantine, or his assistant, shall accompany the lighters or boats which shall be employed in passing to or from the vessel on board of which such guardians are placed, during the passage of

such lighters and boats to and from such vessel, in order to prevent any communication in the transit of the cargo from the ship to the floating lazaret, or to the lazaret at Chetney Hill; and shall take care, after every removal of goods, that no remnant of cotton, or of any other article enumerated in either of the said two classes hereinafter stated, remain in the lighters or the boats, but shall, before leaving off work, collect and deliver such remnants into the lazaret with the last package, which they shall then carry from the said vessel.

XX. The said guardians shall take care, that, after the discharge of the cargoes into the lazaret, the holds and between decks of the ships shall be completely swept, and the sweeping burnt.

XXI. The said guardians shall diligently search the lockers, chests, and other repositories of the officers, passengers, and crews, and every part of the vessels, so that no article, so enumerated in either of the said two classes, nor any matter or thing considered as susceptible of infection, remain undelivered to the lazaret, unless what shall be declared by the said superintendent, or medical attendant, to be requisite for daily use; and shall see that all the said chests, lockers, and other repositories, and all the clothes and bedding, in the vessel, be daily opened and aired, in such manner as shall be directed by the superintendent of quarantine, and shall also make the like diligent search in vessels laden with other goods not enumerated in either of the said classes, so as to be able the better to ascertain that nothing enumerated, or considered susceptible, has been left on board.

XXII. One of the said guardians shall make a daily report to the superintendent of quarantine, or his assistant, and to the medical attendant, of the state of health of every person on board, and whether the regulations of quarantine have been properly complied with; and, in case any impediment shall occur in the execution of the duties required of the said guardians, they shall give notice immediately to the master or commander of the vessel in the first instance; and, if thereupon such impediment be not instantly removed, they shall then give notice thereof to the superintendent of quarantine, or his assistant, who shall take care to use effectual means for the removal of the same.

XXIII. If any person on board shall fall sick, and any medical person shall be on board the vessel, such medical person shall confer with the medical attendant along-side the vessel, the medical attendant keeping to windward, at a distance of not less than ten feet; and, in case there shall be no medical person on board, and it shall be necessary for the medical attendant to inspect the sick, the visit shall be made at the ship's boat by the medical attendant in his own boat, keeping to windward at the like distance of not

less than ten feet; and, if any patient, after being examined in the manner before-mentioned, shall be found to require such medical or chirurgic aid, as cannot properly be administered, except in the pest-house, or hospital-ship, he shall be removed either to such pest-house, or hospital-ship, as the case may require.

XXIV. Patients under circumstances which shall induce suspicion, that they may be infected with any pestilential disorder, whether such person shall be in the lazaret at Chetney Hill, or in the floating lazaret, or in any of the ships or vessels performing quarantine, shall be sent to the pest-house, or to one of the huts on shore, or to the hospital-ship, according to the discretion of the superintendent of quarantine, with the advice of the medical attendant; and when it shall appear that there is no longer any reason to apprehend any danger of infection from such patients, they shall be removed to a more commodious apartment in the lazaret, there to complete the remainder of quarantine.

XXV. In case any pestilential disorder shall actually discover itself on board any vessel, or among any of the persons under quarantine, whether in any vessel performing quarantine in the lazaret at Chetney Hill, or in the floating lazaret, the persons affected with such disorder shall be removed, with all possible care and dispatch, under the special direction of the superintendent of quarantine, and medical attendant, to the pest-house, or to one of the huts on shore, and a proper attendant shall be assigned to such patients by the superintendent of quarantine, with the advice of the medical attendant; and such patients shall be visited at a due distance by the said medical attendant, and in case near approach shall be required, some person shall be specifically appointed by the medical attendant for that purpose.

XXVI. The passengers and crew of any vessel under quarantine may have the assistance of any medical persons they may desire from shore, subject to the official visits of the medical attendant, and to such regulations and restrictions as the superintendent of quarantine, with advice of such medical attendant, shall judge necessary; but all such medical persons, as well as all others, if they communicate by contact with the sick, shall perform the same quarantine as the sick persons themselves.

XXVII. After the quarantine-guardians shall have been placed on board any vessel, the pilot may quit such vessel, and be removed to an apartment in the lazaret at Chetney Hill, or in the hospital ship, provided he comes from a vessel having no suspicious sickness on board; but, if otherwise, such pilot shall be sent to the pest-house, or to one of the huts on shore, at the discretion of the superintendent of quarantine, with

the advice of the medical attendant; and such pilot shall, in both cases, continue under quarantine until the probationary airing of goods, wares, and merchandise, as hereinafter directed, shall be finished; and, at the expiration of such probationary airing, such pilot, if he continue free from infection, shall be fumigated and discharged from quarantine; provided always, that, during the performance of such quarantine, either on board the hospital-ship, or at the pest-house, or huts on shore, such pilot shall not have communication with any other person, except under similar restrictions to those herein directed, with regard to other persons under quarantine.

XXVIII. Until the lazaret at Chetney Hill shall be erected, such of the passengers and crew of any vessel arriving as above-mentioned, not furnished with clean bills of health, as may be desirous of performing quarantine in a separate vessel, to be hired at their own expense, shall, in case the superintendent of the quarantine, with the advice of the medical attendant, shall see no objection thereto, be permitted to quit the vessel in which they arrived before the hatches are opened, and to go on board any other vessel to perform quarantine, (in which other vessel a quarantine guardian shall be placed at the expense of the person or persons so performing quarantine), and such persons shall there perform a quarantine of thirty days; and such of the passengers and crew as shall remain on board the ship in which they shall have provided, shall continue under quarantine until the ship shall be discharged therefrom.

XXIX. Provided always, That, in case any pestilential accident shall occur among the ship's crew or passengers during the probationary airing of the goods, at whatever stage of the quarantine such accident may happen, the quarantine of all the passengers and crew, and of the pilot, (if there shall be a pilot at that time liable to quarantine in respect of his having been on board such ship or vessel), as well as of the goods, wares, and merchandise, shall re-commence; the sick persons shall be sent to the hospital-ship, or to the pest-house, or to the huts on shore, as above directed; the external guard shall be immediately doubled, and notice of such accident shall be given with all possible dispatch to the privy-council.

XXX. All persons, who shall have to perform quarantine in the lazaret at Chetney Hill, shall perform such quarantine for the same time, and under the same regulations, as those who are permitted to perform quarantine in separate vessels as hereinbefore directed.

XXXI. The baggage, wearing-apparel, books, and every other article belonging to any person on board any vessel arriving as above-mentioned, and not furnished with a clean bill of health, for which they shall have

no immediate occasion, shall be sent to the lazaret at Chetney Hill, or to the floating lazaret, for the purpose of being aired in like manner as other goods of the same description; and, before any of the passengers or crew shall be discharged from quarantine, they, their clothes, and other effects which have remained with them, shall be fumigated.

XXXII. Immediately after the pilot, and such of the passengers and crew of vessels so arriving without clean bills of health as may be directed to perform quarantine in any of the modes hereinbefore mentioned, shall have quitted the vessel in which they shall have arrived, the hatches of such vessel shall be opened, and the probatory airing of the cargo shall commence; which probatory airing shall be in the following manner, viz.

Such a number of bales of the enumerated goods, wares, and merchandise, of the first class, hereinafter stated, as can be ranged upon deck, shall be taken from the hold, and, the seams at one or both ends being ripped open, the contents shall be handled as much as possible by the sailors, in the presence of one of the guardians, and, under this process of handling and turning, such bales shall remain exposed to the air for six days, and on the subsequent day shall be put into a condition to be, and shall accordingly be, delivered to the lighter appointed to transport them to the floating lazaret, or to the lazaret at Chetney Hill; and, as soon as the deck is cleared of the first parcel of goods, a second parcel shall be hoisted up, and treated in like manner for the space of three days, and on the subsequent day shall in like manner be put into such condition, and shall be so delivered as aforesaid; after which, a third parcel shall be hoisted up, and treated in the same manner also for the space of three days, and on the subsequent day shall, in like manner, be put into such condition, and shall be so delivered; but, in case of any suspicious circumstances arising, the probatory airings shall be extended to eight, six, and four days, making, with the three intermediate days, twenty-one days in the whole; or even to a greater length of time, if circumstances shall require.

XXXIII. Of the goods, wares, and merchandise, which shall arrive in vessels without clean bills of health, the articles herein after enumerated in class the first, shall be carried to the floating lazaret in Standgate Creek, or to the lazaret at Chetney Hill, there to be unpacked, opened, and aired for the space of forty-days, viz.

Class the first.—Consisting of those articles which are considered as most liable to infection:—apparel of all kinds, artificial flowers, bast, or any article made thereof, beads, bracelets, or necklaces in strings, beds, bed-ticks, books, brooms of all sorts, brushes of all sorts, burdets, camblots, canvass, Carmentia-wool, carpets, cordage not tarred, cot-

ton-wool, cotton-yarn, cotton-thread, all articles wholly made of, or mixed with, cotton, silk, wool, thread, or yarn, down, feathers, flax, furriers'-waste, goats'-hair, gold or silver on thread, cotton, hair, wool, silk, or any other substance hereinbefore enumerated; grooms, hats, caps, or bonnets, of straw, chip, cane, or any other material, hemp, hoofs, horn and horn tips, hair of all sorts, leather, linen, liquor of any kind in bottles, or flasks, lute-strings, catlings, or harp-strings, maps, mattresses, mats and matting, mohair-yarn, nets, new or old, paper, pack-thread, parchments, pelts, plaiting of bast-chip, cane-straw, or horse-hair, quills, rags, sails and sail-cloth, silk, viz. crapes and tiffanies, husks and knubs, raw-silk, thrown and organzine silk, waste silk, wrought silk, skins, hides and furs, and parts or pieces of skins, hides and furs, whether undressed, or in part or wholly tanned, tawed, or dressed, sponges, straw, or any article made of, or mixed with, straw, stockings of all sorts, thread, tow, vellum, whisks, wool, whether raw, or anywise wrought, yarn of all sorts, and all other goods whatsoever, if they shall have arrived in or with packages, consisting wholly, or in part, of any of the articles above enumerated in this class, unless such goods shall be removed from such packages as hereinafter mentioned.

XXXIV. The expurgation of the goods, wares, and merchandise, enumerated in class the first, as before-mentioned, after they have been removed to the floating lazaret at Standgate Creek, or to the lazaret at Chetney Hill, shall proceed in the following manner: that is to say, all bales of cotton shall be opened from one end to the other, and so much taken out as to leave room for handling, daily, the interior of the bale.

The following articles, viz. raw wool, goats'-wool, Carmentia-wool, and hair, shall be taken out of the bags or bales, and shall be ranged in low heaps, not above four feet high, and successively handled and rummaged.

All bales of raw-silk, silk stracee (or refuse), and silk-thrown, shall be opened on one side from end to end, the cords loosened, and way made, by removing a number of skeins, for the porters to handle the interiors of the bales; and, at the expiration of twenty days, that side of the bale which has been opened being resewed, the other side shall be ripped open, and the contents handled and aired in the like manner till the thirty-fifth day, when the bales shall be put in order for delivery.

All packages of cotton, of yarn, of thread, of silk stuffs, of cotton stuffs, of burdets, of camblots, and of linen, shall be opened, and the piece-goods piled in rows, lattice fashion, or in pyramids, turned every four days, and completely spread out and suspended on cords for several days.

Cases of paper, books, parchment, cases

of sponges, and silk and thread stockings, shall be entirely unpacked, and the smaller parcels separated from each other, and so disposed, as to admit of thorough airing. Feathers, straw hats, artificial flowers, coral-beads in strings, and brushes shall be spread out in the same manner; carpets, furs, hides, and skins shall be unbaled, and each piece shall be spread and suspended on cords, and sometimes in the open air, and frequently turned.

All goods packed in or with straw, cotton, or any other article enumerated in the said first class, or considered as susceptible, shall be entirely taken out of, or separated from, the same, and carefully aired.

All goods enumerated in the said first class, concerning the expurgation of which, no particular directions have been hereinbefore given, shall be unpacked, opened, aired, and handled, in like manner, so far as may be, as is hereinbefore directed, with regard to goods of a similar description.

XXXV. Of the goods, wares, and merchandise, which shall be imported in any vessel arriving as above-mentioned, and not furnished with clean bills of health, the articles hereinafter enumerated in class the second, shall, in like manner, be carried to the floating lazaret, or to the lazaret at Chetney Hill, there to be unpacked, opened, or treated, according to the nature thereof, and aired for the space of thirty days; viz.

Class the second.—Consisting of those articles which are considered as liable to infection, but in a less degree; senna, jalap, gum arabic, gum tragacanth, gum myrrh, gum opium, gum scammony, antimony, cantharides, alum, juniper-berries, pomegranates, flowers and seeds, sal nitre, sal ammoniac, madder, shumac, galls, tobacco, coffee, wood in raspings, and cork.

XXXVI. The expurgation of all the goods, wares, and merchandise, enumerated in the said second class, shall be performed by exposing them to the air as much as possible, and by moving them, from time to time, so as to admit of free ventilation.

XXXVII. After the delivery of all the goods, wares, and merchandise, enumerated in the two classes, before-mentioned, into a floating lazaret, or into the lazaret at Chetney Hill, the vessel, with the rest of the cargo, shall then commence and perform a quarantine of thirty days, during which the packages of the goods, wares, or merchandise, not enumerated in either of the classes before-mentioned, remaining on board such vessel, shall be frequently swept and shifted, and moved, from time to time, as much as possible, according to the nature thereof, so as to admit of free ventilation; and at the expiration of the said thirty days, if all persons on board continue free from every appearance of infection, the vessel, and such part of the crew, passengers, and cargo, as

shall have remained on board, shall be finally fumigated and discharged.

XXXVIII. Provided always, that, if all the persons on board remain in health, dried fruits, having been shifted from baskets, or other packages made of articles enumerated in the said first class, or considered as susceptible, when such dried fruits shall have been imported in such packages, may be delivered in twenty days; dried fruits in packages of wood, in ten days; barrels of oil, the bungs being first tarred, and the barrels brushed, and then thoroughly washed in sea water, in ten days; grain, pulse, and other seeds in bulk, on the eleventh day, after having been passed through an iron grating, in order to detect any susceptible matter that may be mixed therewith; grain, pulse, and other seeds in sacks, or in casks, or baskets of rush-mat, being shifted into fresh sacks, or packages, in like manner on the eleventh day, being likewise passed through an iron grating; but, in all cases where any goods, wares, or merchandise, shall have been shifted from such susceptible packages as aforesaid into fresh packages, the said susceptible packages shall be sent to the lazaret to perform quarantine, according to the nature thereof, or shall be destroyed, at the option of the importer.

XXXIX. The quarantine of all goods, wares, and merchandise, (as well such as are directed to be left in, as those which are to be removed from the vessel), in cases where the cargo shall consist partly of articles enumerated in the first and second classes, and partly of non-enumerated articles, shall commence, and be computed, from the day on which the whole of the articles enumerated in the said two classes, shall have been removed from the vessel importing the same, to be opened and aired in the manner before directed, except as hereinbefore particularly excepted.

XL. The quarantine of thirty days to be performed by all vessels arriving without clean bills of health, but with cargoes wholly consisting of articles considered as not susceptible of infection, and not enumerated in either of the two classes before stated, shall commence, and be computed from the day on which the quarantine guardians shall be put on board.

XLI. All vessels, and all persons, goods, wares, and merchandise on board thereof, arriving with suspected bills of health, (commonly called touched patents or bills), shall respectively perform quarantine, and be treated in the same manner as above directed concerning vessels arriving without clean bills of health, and persons, goods, wares, and merchandise arriving in such vessels: except only that such persons, goods, wares, and merchandise so arriving with suspected bills of health, shall respectively be subjected to ten days less quarantine.

XLII. With respect to all vessels whatso-

ever, having on board cotton, wool, thread, or yarn, or any other of the articles enumerated in the first class before stated, importing the same into any port or place of this kingdom, or Guernsey, Jersey, Alderney, Sark, or Man, from any port or place in Europe, without the Straits, or in the continent of America, at which there is not a regular establishment for the performance of quarantine, the master, or other person, having charge of every such ship or vessel, is hereby required to bring with him a declaration made by the owner, proprietor, shipper, or consignee, of such vessel, or of the goods, wares, and merchandise on board the same respectively, upon oath, before some magistrate of the port or place whence such master or commander of such vessel shall have brought the said goods, wares, and merchandise, and attested by such magistrate, and also by the British consul, or vice-consul; or, in case there shall be no British consul or vice-consul there, then by two known British merchants, certifying whether the said goods, wares, and merchandise are not of the growth, produce, or manufacture of Turkey, or of any place in Africa, within the Straits of Gibraltar, or in the West Barbary on the Atlantic Ocean; or, affirmatively, of what place they are the growth, produce, or manufacture; and if they are of the growth, produce or manufacture of any of the countries last mentioned, then certifying whether the said vessel is or is not the same in which the goods, wares, and merchandise so imported were brought from Turkey, or from any of the countries last mentioned; and, in case the vessel is the same, the master or commander of such vessel is hereby required to bring with him the bill or bills of health granted at the port where any of the goods were originally taken on board, or copies thereof, attested by a notary public: and, if the vessel, having on board such goods, wares, and merchandise, shall be other than that in which they were imported into any port or place in Europe, without the Straits, or on the continent of America, at which there is not a regular establishment for quarantine, the master of such vessel is hereby required to bring with him a declaration, made and attested in like manner as the declaration before mentioned, certifying whether the said goods, wares, and merchandise were imported into the ports of the countries last mentioned in a vessel with or without a clean bill of health: and such master of any such vessel, if the same shall be bound to the port of London, or to the river Thames, or Medway, shall forthwith produce a declaration or declarations (as the case may be) to the superintendent of quarantine at Standgate Creek; or, if the same shall be bound to any of the out-ports or islands aforesaid, to the proper officer of the customs or of quarantine at such out-port or place; and if

it shall appear that none of the goods, wares, or merchandise on board such vessel are of the growth, produce, or manufacture of Turkey, or of any place in Africa within the Straits of Gibraltar, or in the West Barbary on the Atlantic Ocean, such vessel importing the same shall not be obliged to perform quarantine; but shall, on production of such declaration to the proper officers of the customs, be admitted to an entry in the usual and legal manner; but if it shall appear, that such goods, wares, or merchandise, or any part thereof, are of the growth, produce, or manufacture of any of the countries last mentioned, then the superintendent of quarantine at Standgate Creek, or the proper officer of the customs employed in the service of quarantine at the out-port or place at which such vessel shall arrive, as the case may be, shall take care that every such vessel, as well as the crew, passengers and cargo on board the same, shall perform quarantine, according to the nature of the case, at such and the same places as hereinbefore appointed for the performance of quarantine, for the same time, and in the same manner, as vessels, their crews, passengers, and cargoes, coming from or through the Mediterranean, or from the West Barbary on the Atlantic Ocean, with clean bills of health, are hereinbefore respectively required to perform quarantine.

XLIII. All vessels arriving in the ports of this kingdom, or Guernsey, Jersey, Alderney, Sark, or Man, having come from the Mediterranean, or from the West Barbary on the Atlantic Ocean, which with their crews, passengers, and cargoes, shall have previously performed quarantine in the lazaret of Malta, Ancona, Venice, Messina, Leghorn, Genoa, or Marseilles, shall, upon their arrival, be put under quarantine in some of the ports or places hereinbefore appointed for the performance of quarantine, until the master or commander of such vessel shall have produced to the superintendent, or proper officer of the customs employed in the service of quarantine, the proper documents to prove that such vessel, and the crew, passengers, and cargo, on board the same, duly performed quarantine in one of the lazarets last mentioned; and upon so producing such documents, the said vessel shall be forthwith admitted to re-port, and all goods, wares, and merchandise, on board thereof, not hereinbefore enumerated in the first class before stated, shall be admitted to an entry; but all goods, wares, and merchandise, on board any such vessel, which are enumerated in the first class before stated, shall in such case perform a farther quarantine of fifteen days at some one of the ports or places hereinbefore appointed for that purpose, in such manner as has been heretofore practised.

XLIV. All masters, or other persons having the charge of any ships or vessels

clearing outwards from any port or place in Great Britain, or the islands aforesaid, for any port or place in the Mediterranean, or in the West Barbary on the Atlantic Ocean, or for any port or place respecting which there shall, at the time of such clearing out, be any order of his majesty in council in force, subjecting ships and vessels coming thence to quarantine, shall receive from the principal officers of the customs at such port or place, a printed paper, containing an abstract of such quarantine regulations as shall be thought necessary to be most generally notified and observed by such masters, their officers, crews, and passengers on board; and every such master or other person having charge of any such ship or vessel, shall cause the same printed paper to be affixed on some convenient and conspicuous part of his said ship or vessel, and there to remain affixed until the return of the said ship or vessel to some port or place in Great Britain, or the islands aforesaid, provided the said ship or vessel shall return to Great Britain, or the islands aforesaid, within twelve months.

XLV. Every commander, master, or other person having the charge or command of any ship or vessel about to sail from any port or place in Great Britain, or the islands aforesaid, for any port or place in the Mediterranean, or in the West Barbary on the Atlantic Ocean, or for any port or place respecting which there shall, at the time of such clearing out, be any order of his majesty in council in force, subjecting ships and vessels coming thence to quarantine, shall, before his departure, provide and take on board one or more of the quarantine signal flags and lanterns directed by the hereinbefore recited act of parliament, and likewise a proper quantity of materials and instruments for fumigation and immersion, and shall keep the same on board, to be used in the manner hereinbefore directed, upon the return of such ship or vessel to any port or place in Great Britain.

XLVI. The commanders of any of his majesty's ships of war, who shall meet any vessel liable to perform quarantine, coming to any of the ports of Great Britain, or of Guernsey, Jersey, Alderney, Sark, or Man, shall take due care to prevent the landing of any goods, wares, merchandise, or persons from on board the same, until they shall be put under the direction of the superintendent of quarantine at Standgate Creek, or of the officers of his majesty's customs employed in the quarantine service at any of the out-ports, or places hereinbefore mentioned.

XLVII. The commissioners, and other officers of the customs, are to use their utmost diligence and care, that all the regulations for the performance of quarantine before directed, be duly observed.

XLVIII. The commanders of his majesty's ships of war, forts, and garrisons, lying near the sea-coasts, and all justices of the peace, mayors, and sheriffs, shall aid and assist the officers of customs, and all others concerned in stopping such ships as aforesaid, and in bringing them to the places appointed for the performance of quarantine, as well as in enforcing due performance thereof.

The regulations herein contained, to take effect and be in force from the tenth day of May, 1805.

By order of council, dated November 1805, all the regulations in section 42. of the above order are extended to all vessels having on board any of the goods enumerated in the first class thereof, and imported in any ship from any place in Europe without the Straits, or on the continent of America, at which there is not a regular establishment for quarantine, and arriving in any of the ports of Great Britain, Guernsey, Jersey, Alderney, Sark, or Man, from any of the ports in Newfoundland or Cape Breton, or other adjacent islands.

By like order, July 21. 1806, if a master shall bring with him from any place where there is a regular establishment of quarantine a declaration on oath made by the owner, proprietor, shipper, or consignee, before the British consul or vice-consul at such place, to the same purport as that required to be made before some magistrate, it shall have the same effect as the certificate required by sect. 42. of the above order.

By like order of 26th April, 1817, the case of a vessel sailing with goods from any of the ports declared liable to infection to any other port *not* declared so liable, and having there landed the said goods, and afterwards arriving at any place of the United Kingdom, or in the islands of Guernsey, &c. &c. is provided for, by declaring that quarantine shall be dispensed with on condition that the master shall declare upon oath that forty days have intervened since such goods had been discharged from the said vessel at the place not declared liable to infection.

And by like order, May 31. 1817, vessels which shall have performed quarantine at the lazaret at Trieste, were declared only to be liable to the regulations contained in section 43. of orders of April 5. 1805, with respect to vessels from Malta, Ancona, Venice, Messina, Leghorn, Genoa, or Marseilles.

Quarantine Duties payable on Vessels, their Cargoes, or any Part thereof, which shall have performed Quarantine as under mentioned.

	With a clean bill of health.	Without a clean bill.
For every vessel, which vessel, or the cargo of which, or any part whereof shall have performed quarantine in Great Britain, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, and which shall have arrived,		
1. From any port of Turkey, or any place in Africa, within the Straits of Gibraltar, or in the West Barbary on the Atlantic Ocean, the ton burthen - - -	0 7 6	0 15 0
2. From any place whatever (except those enumerated in art. 1.) - - -	0 3 0	0 10 0
3. From any place whatever, with a cargo which, in whole or in part, shall consist of goods, the growth, produce, or manufacture of Turkey, or of any place in Africa, within the Straits of Gibraltar, or in the West Barbary on the Atlantic Ocean, the ton burthen - - -	0 7 6	0 7 6
4. For every vessel which shall have so arrived under such circumstances as shall induce his majesty in council, or the lords, &c. of the privy council, to subject such vessel to the like quarantine as ships arriving from Turkey, the ton burthen - - -	0 7 6	0 15 0

N. B. An additional shilling per ton burthen is paid on every vessel as aforesaid entering inward in the port of London.

QUART is a kind of measure, containing the fourth part of a gallon, and is equivalent to two English pints. The quart, wine measure, is 57.75 cubic inches; the quart, beer, and ale measure, 70.5 cubic inches; and a quart, corn measure, 67.2.

QUARTATION, *Parting*, or *Depart*, among refiners, a method of purifying gold by melting three parts of silver with one of gold, and then casting the mixture into aquafortis; which, dissolving the silver, leaves the gold at bottom, in form of a black powder. See ASSAYING.

QUARTER, the fourth part of any thing, the fractional expression for which is $\frac{1}{4}$. Quarter, in weights, is used for the fourth part of a hundred weight avoirdupois, or 28 lbs. As used in dry measure, quarter is the fourth part of a ton in weight, or eight bushels.

QUARTER-DAYS. LADY-DAY, MID-SUMMER, MICHAELMAS, and CHRISTMAS. See those titles.

QUARTER-DECK of a Ship, is the short upper deck. See SHIP.

QUARTER-MASTERS, or *Quartcers*, in a ship of war, are officers whose business it is to rummage, stow, and trim the ship in the hold; to overlook the steward in his delivery of victuals to the cook, and in pumping or drawing out beer, or the like. They are also to keep their watch duly, in conning the ship, or any other duty.

QUARTER-WIND, at sea, a wind that blows upon the ship's quarter. A quarter-wind, is that which comes in abaft the main-mast shrouds, even with the quarter of the ship. It is the best of all winds, as filling all the sails; whereas a wind blowing full

in the stern, is kept off by the mizzen and main-mast.

QUARTERN, the quarter of a pint, dry measure.

QUARTO, a book in which every sheet, being twice doubled, makes four leaves or eight pages. It is also a Portuguese measure.

QUARTZ. Some chemists make a distinction between quartz and rock-crystal. In general, those crystals of the siliceous order which are clear and perfect, and do not crack in the fire, are called rock-crystals; and those which are coloured, full of flaws, rounded and irregular, are called quartz.

The transparent quartz or rock-crystal is either colourless and crystallised in hexagonal pyramids, and then called mountain-crystal; or in various other forms, or irregular.

The purest and most transparent of these crystals form the false diamond, called Bristol, or Kerry, stone, *diamant d'Alençon*, &c.

The coloured transparent crystals derive their tinge generally from metallic particles in exceeding small proportion; they all lose their colour when heated; these form the false gems. The most remarkable are the Red, from Oran in Barbary; false rubies. Yellow, from Bohemia; false topazes. Green; false emeralds and prases.

Violet, } from Bohemia and Saxony.
Blue, }

It is said, that brown crystals may be cleared by boiling them in tallow.

The opaque quartz, or pebbles, are also crystallised, or irregularly figured, either white, gray, or yellowish, or tinged of other

colours by metallic particles. The former are less pure than those of the first series, containing a larger proportion of clay, or at least the clay is less perfectly united with the siliceous part. They are often found in round masses in the beds of rivers.

The coloured opaque quartz are either, 1. Black, being mixed with a large proportion of iron. 2. Red. 3. Blue, from Uto, in Sweden. 4. Green, found at Adelsdorf, in Sweden.

Though the powdery state of other stones does not deserve any particular notice, yet that of quartz or silex does, from the great use that is made of it, and from its seeming to possess properties which are incompatible with it in a grosser state. It is of various colours, and incapable of forming a mass, or hardening with water. The purest is white, the minute particles of which, when inspected through a lens, are transparent, but it is seldom perfectly pure.

QUARTZ (ELASTIC). Sandschiefer, flexible stone. This stone, remarkable for a certain degree of elastic flexibility, was brought about thirty years ago from the diamond mines of the Brazils. It is met with likewise in Thuringia. It is supposed, however, to have been known in the sixteenth century, and to be described by Gassendi, in his life of Peirsec, as a flexible whetstone. In its form and appearance it resembles the Turkey bone, or novaculite.

QUASSIA, (GER. Quassie. DU. Kwassiehout. DA. Quassebark. SW. Quassieträd. FR. Bois de quassie. IT. Legno di quassia. SP. Leno de quassia. PORT. Páo de quassia. LAT. Lignum quassia,) a tree growing in South America and the West Indies, of which there are three species, the *amara*, *simaruba*, and *excelsa*. It received its name from Quassi, a negro of Surinam, who first discovered its medicinal virtues.

1. *The quassia amara*, is a native of South America, particularly of Surinam, and also of some of the West India islands. The root, bark, and wood, of this tree, have all places in the materia medica. The wood is most generally used, and is said to be tonic, stomachic, antiseptic, and febrifuge.

2. *The quassia simaruba*, is common in all the woody lands in Jamaica. The wood of this tree is hard, and useful for buildings. It splits freely, and makes excellent staves for sugar-hogsheads. It has no sensible bitter taste. The leaves are numerous and alternate. The flowers are of a yellow colour, and placed on spikes beautifully branched. The fruit is of that kind called a *drupa*, and is ripe towards the end of May. It is of an oval shape, is black, smooth, and shining. The pulp is fleshy and soft; the taste nauseous and sweet. The nut is flattened, and one side winged. The kernel is small, flat, and tastes sweet. The roots are thick, and run at a small depth under the surface of the ground to a considerable dis-

tance. The bark is rough, scaly, and warted. The inside, when fresh, is a full yellow, but when dry, is pale. It has but little smell. The taste is bitter, but not very disagreeable. This is the true *cortex simaruba* of the shops. It used to be imported formerly from Guiana; but we now have it from our own islands at a more moderate rate.

3. *The quassia excelsa*, or *polygama*, was named by Sir Joseph Banks, Dr. Solander, and Dr. Wright. It is very common in the woodlands of Jamaica; is beautiful, tall, and stately; some being 100 feet long, and 10 feet in circumference; eight feet above the ground. The trunk is straight, smooth, and tapering; sending off its branches towards the top. The outside bark is pretty smooth, of a light grey, or ash-colour, from various lichens. The bark of the roots is of a yellow cast, somewhat like the *cortex simaruba*. The wood is of a yellow colour, tough, but not very hard. It takes a good polish, and is used as flooring. The flowers are small, of a yellowish-green colour, with a very small calyx. The fruit is a smooth back *drupa*, round-shaped, and of the size of a pea. Except the pulp of the fruit, every other part of this tree has an intensely bitter taste. Its taste and virtues are nearly equal to the quassia of Surinam. The happiest effects result from the use of this medicine in obstinate remitting fevers from marsh-miasmata; in agues which have resisted the use of Jesuits' bark, and in dysenteries of long standing. It is in daily practice in dropsies from debility; either in simple infusions, or tincture by itself, or joined with aromatics and chalybeates. Physicians in Jamaica prescribe it with great success.

Besides its use in medicine, quassia is consumed in large quantities by the brewers to give a bitter taste to their beer; but is very much inferior to hops for that purpose, as well in flavour, as in the essential quality of preventing the liquor from becoming sour. This however is prohibited by statute. See HOPS.

QUAY or KEY. See KAY.

QUEEN'S WARE, the yellow stone-ware. See STONE-WARE.

QUERCITRON BARK, the bark of a species of oak growing spontaneously on the continent of North America, particularly in Massachusetts Bay, where it is commonly called yellow oak; and in other parts, particularly in Pennsylvania, the black oak. Linnæus terms it *quercus nigra*. — It is very rough, of a dark brown or black colour on the outside, and of a yellowish brown within. If boiled in water, its decoction becomes yellow by the addition of alum; or a kind of olive brown, by the addition of a solution of iron by some mineral or vegetable acid. On account of this property, it has been introduced for dyeing yellow. Its tinging particles very much resemble, in their pro-

perties and effects, those of the weld plant; though all the colours given by the latter may be communicated more advantageously by the quercitron bark. This bark may be advantageously peeled from the tree in the spring months; and as its rough blackish outside part, making nearly half of the whole, contains little or no colouring matter, it is cut off from the inner part; which being thoroughly dried, and coarsely ground, is then closely packed and pressed in proper casks, and so shipped.

QUERN-STONES, a name given by some traders to grindstones, and the stones of hand-mills in general.

QUESTMEN, persons appointed to enquire into abuses, especially such as relate to weights and measures.

QUICKEN-TREE, **MOUNTAIN-ASH**, or **ROAN-TREE**, an indigenous shrub growing in hedges, woods, mountains, or boggy situations, principally in Wales, Scotland, and the northern parts of England.

The wood is tough, and durable, being advantageously converted into tables, spokes for wheels, chairs, &c. The roots are also very firm, and are formed into spoons, handles for knives, and similar utensils.

The branches, leaves, and unripe fruit of this tree, have also been usefully employed in tanning.

QUICKSILVER. See **MERCURY**.

QUILLS, (GER. *Posen*, *Federkiele*. DU. *Fennen*, *Penneschagten*. DA. *Penne*. SW. *Pennor*. FR. *Tuyaux*. IT. *Canoni di penna da scrivere*. SP. *Canones para escribir*. PORT. *Canos para escrever*. RUS. *Stivoli*. POL. *Pipy*, *Pipki*.) large feathers taken out of the end of the wings of geese, ostriches, swans, turkies, crows, &c. They are denominated according to the order in which they are fixed in the wing; the second and third quills being the best for writing, as they have the largest and roundest barrels. Crow-quills are chiefly used for drawing. In order to harden a quill that is soft, thrust the barrel into hot ashes or sand, stirring it till it is soft, and then taking it out, press it almost flat upon your knee with the back of a penknife, and afterwards reduce it to roundness with your fingers. Another method to har-

den quills, is by setting water and alum over the fire, and while it is boiling, put in a handful of quills, the barrels only, for a minute, and then lay them by. Large quantities of quills were annually imported into Great Britain from Germany, and Holland. The goodness of quills is judged by the size of the barrels, but particularly by the weight; hence the denomination of quills of fourteen, fifteen, &c. loths; viz. the thousand consisting of twelve hundred quills, weighing fourteen, fifteen, &c. loths. The loth is a German weight, equivalent to something more than an ounce. Particular attention should be paid, on purchasing quills, that they may not be left-handed, that is, out of the left wing.

QUILTING, a method of sewing two pieces of silk, linen, or stuff on each other, with wool or cotton between them; by working them all over in the form of chequer or diamond-work, or in flowers. The same name is also given to stuff so worked.

QUINQUINA. See **JESUITS' BARK**, and **CHINA**.

QUINTAL, a hundred pounds weight. The quintal differs in many places, according as the pound consists of more or fewer ounces. The English quintal consists usually of 112 lbs. avoirdupois, and is divided into four quarters. See **WEIGHTS** and **MEASURES**.

QUIRE of paper, a quantity of twenty-four sheets.

QUI TAM, in law, a species of action wherein a penalty is given, half to the king and half to the informer: this term is taken from part of the declaration, which states, the party sues, *Qui tam, as well for himself, as for the King*.

QUOIN, or **COIN**, on board a ship, a wedge fastened on the deck close to the breech of the carriage of a gun, to keep it firm up to the ship's side.

QUOTIENT, in arithmetic, is the number produced by the division of the two given numbers, the one by the other.

QUOYL, or, as it is by corruption pronounced **COIL**, is, in sea-language, a ring or circle, made by rolling the cable round in that shape.

RAB

R, The seventeenth letter of the alphabet, as a numeral denotes eighty; and with a dash over it, thus $\overline{R}$, it signifies eighty thousand. R or R, in medical prescriptions, stands for *recipe*, or take.

RABBETING, in carpentry, the planing or cutting of channels or grooves in boards. In ship-carpentry, it signifies the letting-in

RAC

of the planks of the ship into the keel; which, in the rake and run of a ship, is hollowed away, that the planks may join the more closely.

RABBIT-SKINS. See **CONEY-WOOL**.

RACK. See **ARRACK**, a liquor.

RACK, an engine of torture to extort

confession. Formerly used by most governments, but now, it is presumed, only under the authority of the Inquisition.

RACK, in *rigging*, a term for a plank with holes in it.

RACK-RENT, the full or utmost rent lands or tenements demised will bear.

RACKOON-SKINS, (GER. *Schuppen*. DU. *Schobben* *Espannen*. DA. *Sjubskind*. SW. *Sjuppenskin*. FR. *Ratons* ou *Marmottes*. SP. *Mapaches*.) are taken from an animal of the bear genus, which inhabits the northern parts of America. It is also found in some of the West India islands. The colour of this animal is grey; the face white; and each of the eyes imbedded in a large patch of black, which forms a kind of band across the forehead, and is crossed by a dusky stripe running down the nose. The fur of the rackoon is principally consumed by hatters, and is considered as next in merit, for their purposes, to beaver.

RAFT, a sort of float, formed by an assemblage of various planks or pieces of timber fastened together side by side, so as to be conveyed more commodiously to any short distance in a harbour or road than if they were separate. The timber and plank with which merchant ships are laden, in the different parts of the Baltic Sea, are attached together in this manner, in order to float them off to the shipping.

RAFTERS, in building, are pieces of timber, which standing by pairs on the raising piece, meet in an angle at the top, and form the roof of a building. It is a rule in building, that no rafters should stand farther than 12 inches from one another: and as to their sizes or scantlings, it is provided by act of parliament, that principal rafters, from 12 feet six inches to 14 feet six inches long, shall be five inches broad at the top, and eight at the bottom, and six inches thick. Those from 14 feet six inches to 18 feet six inches long, to be nine inches broad at the foot, seven inches at the top, and seven inches thick; and those from 18 feet six inches to 21 feet six inches long, to be ten inches broad at the foot, eight at the top, and eight thick. Single rafters, eight feet in length, must have four inches and a half, and three inches three quarters, in their square. Those of nine feet long, must be five and four inches square.

Principal rafters should be nearly as thick at the bottom as the beam, and should diminish in their length one-fifth, or one-sixth, of their breadth; the king-posts should be as thick as the principal rafters; and their breadth according to the size of those that are intended to be let into them; the middle part being left somewhat broader than the thickness. See **BUILDINGS**.

RAGS, (GER. *Lumpen*. DU. *Lompen*, *Vadden*. DA. *Klude*. SW. *Lumpor*. FR. *Chiffes*, *Chiffons*, *Drapeaux*, *Drilles*. IT. *Stracci*, *Strazze*. SP. *Trapos*, *Harapos*. PORT.

Farrapos, *Trapos*. Rus. *Trejje*. POL. *Platki*.) which constitute the basis of that most useful article — paper, are a very important commodity throughout Europe. Great Britain itself furnishes the paper-makers with immense quantities of rags; and mean as the business may appear to common observers, it is most certain that some dealers in rags employ several thousand pounds in it. The rag-men buy linen rags of the gatherers, and moreover import the article from abroad. See **PAPER-MAKING**.

Old rags may be imported duty free; and old rags, old ropes, or junk, or old fishing-nets, for making paper or pasteboard, not regularly entered and landed, are forfeited. 11 Geo. 2. c. 7. s. 10.

RAGSTONE, a genus of siliceous fossils, discovered in various parts of Great Britain. It is of a greyish colour, contains a large portion of *talc*, and splits easily into thin scales.

This mineral is used by artificers for the purpose of giving a fine edge to knives, chisels, and other tools which have previously been sharpened upon stones of a coarser texture.

In its appearance it resembles the pumice-stone, in every respect except density, in which this greatly exceeds.

RAGWORT, the common groundsel, *segram*, or *St. James's wort*, a native perennial plant growing in meadows, pastures, and road-sides, and flowering from July to August.

If gathered before the flowers expand, and employed in a fresh state, the ragwort imparts to wool a fine green, though not a permanent colour. But if woollen-cloth be previously boiled in alum-water, and afterwards in a decoction of these flowers, a beautiful deep yellow shade will be produced.

It is said, that by a decoction of the flowers and stalks, while in blossom, the wool, previously steeped in a solution of bismuth, acquires a very permanent olive-colour, displaying a beautiful golden shade.

RAISINS, (GER. *Rosinen*. DU. *Rozynen*. DA. *Rosiner*. SW. *Russin*. FR. *Raisins secs*, ou *passés*. IT. *Uve passe*. SP. *Pasas*. PORT. *Passas*, *Passa de uvas*. Rus. *Issum*. POL. *Rozyński*. LAT. *Uvæ passæ*.) grapes prepared by suffering them to remain on the vine till they are perfectly ripe, and then drying them in the sun, or by the heat of an oven. The difference between raisins dried by these two methods, is very obvious: the former are sweet and pleasant; but the latter have a latent acidity with the sweetness, that renders them much less agreeable. The common way of drying grapes for raisins is to tie two or three bunches of them together while yet on the vine, and dip them into a hot lixivium of wood-ashes, with a little of the oil of olives in it. This disposes them to shrink and wrinkle, after which

they are left on the vine three or four days, separated on sticks in a horizontal situation, and then dried in the sun at leisure, after being taken from the tree. The finest and best raisins are those called, in some places, Damascus, and Jube, raisins; which are distinguished from the others by their size and figure. These are flat and wrinkled on the surface, soft and juicy within, and near an inch long; and when fresh and growing on the bunch, are of the size and shape of a large olive. The raisins of the sun, and jar-raisins, are all dried by the heat of the sun, and these are the sorts used in medicine. The names by which raisins are distinguished among traders, are the following; and the order in which they are placed denotes their relative value, the first being the most esteemed; viz. Muscatels, sun or solis, bloom or jar, Belvedere, Denia or Malaga, Sultana, Lipari, and Smyrna black, and red. The best of these kinds are imported in boxes and jars, and the most inferior in mats. Spain is the country which supplies us with the greatest quantities of this article. Valencia, and Grenada, are the parts of Spain in which raisins are principally prepared, and Malaga is the port whence they are exported in the greatest abundance. Grenada is supposed to produce the best of any part of Spain. Italy, Sicily, and several islands of the Archipelago, and the Mediterranean sea, furnish abundance. Calabria is said to produce the finest of any part of Italy. These are called by the Italians *pansa zebibo*, *regin seno*, &c. They are remarkably large, and are prepared by dipping them three or four times in a hot lixivium, which, without any further attention, indurates and preserves them. They have generally an extremely saline flavour, which is derived from the ashes of the lixivium, and causes thirst in such as eat many of them. These raisins constitute a considerable branch of Neapolitan commerce, abundance of them being sent into France, and other parts of Europe. Those of the Lipari isles are small; such as are called *passolini* by the Italians are the dearest. The raisins of Lipari give rise to a large share of the trade of Sicily, whence they are principally procured. The southern provinces of France, especially Provence, furnish excellent raisins, not very dissimilar to those of Spain. Portugal furnishes raisins of inferior quality. Anatolia and some other parts of Asiatic Turkey produce abundance of excellent raisins, which, for the most part, are sold to the Egyptians. Some of the African islands, particularly that of Glabis, yield raisins of inferior quality, which are generally sent to Alexandria.

Besides their employment for culinary purposes, raisins have several medicinal properties; they are nutritive, balsamic, attenuant, and of considerable service in nephritic disorders.

RAISINS OF THE SUN. (GER. *Zibeben*. DU. *Cibebe*. DA. and SW. *Cibeber*. FR. *Raisins au soleil*, *Raisins au jubis*. IT. *Zibibbi*. SP. *Pasas de sol*. PORT. *Passas de sol*.) See RAISINS.

RAKE, a well-known agricultural implement, consisting of a long handle, and a head set with teeth. These teeth are made either of iron or of wood: the iron-teethed rake is used for dividing ground, and smoothing gravel-walks, &c.: the wood-teethed rake is almost exclusively employed in hay-making. Recently, indeed, iron rakes, with teeth at least a foot in length, and set in frames, have been introduced for making hay.

RAKE of a Ship, is all that part of her hull, which hangs over both ends of her keel. That which is before is called the *fore-rake*, or *rake-forward*; and that part which is at the setting on of the stern-post, is called the *rake-aft*, or *afterward*.

RAM'S HEAD, in a ship, is a great block belonging to the fore and main halyards. It has three shivers in it, into which the halyards are put, and in a hole at the end of it are reeved the ties.

RANGE, among furnishing ironmongers, is used to signify a kitchen-grate, with all its appurtenances complete.

RANGES, in a ship, two pieces of timber that go across from side to side; the one on the fore-castle, a little abaft the foremast; and the other in the beak-head, before the mouldings of the bowsprit.

RANGOES. See ARRANGOES.

RANSOM, signifies properly the sum that is paid for redeeming one that is taken prisoner in war.

The statutes prohibiting ransoms are remedial acts, and are to be construed liberally. It is not necessary that a hostage should be given, in order to constitute a ransom.

In case of a ransom bill, the owners are not liable beyond the value of ship and cargo. *Helly v. Grant*, 1 T. R. 76.

But a promise by a captain of a ship, on behalf of his owners, when ship taken, to a sailor to pay him monthly wages, in order to induce him to become a hostage, is binding on such owners, though they abandon ship and cargo. *Yates v. Hall*, 1 T. R. 75.

A sentence of condemnation of a British ship, (which had been captured by a French privateer, and carried into Bergen, in Norway,) by the French consul at Bergen, is illegal; and if, after such a sentence, the owner re-purchase his ship at a public auction at Bergen, he cannot recover the money so paid from the underwriter. For such a contract is a *ransom*, and illegal under statutes 22 Geo. 3. c. 25. and 35 G. 3. c. 66., which expressly prohibit the ransom of the ships of his majesty's subjects taken by an enemy. *Havelock v. Northwood*, 8 T. R. 268.

RAPE-SEED; (GER. *Rübsaamen*, *Rüb-*

sen. Du. Raapzaad. **DA.** Roefrö. **Sw.** Roffrö. **Fr.** Graine de navette, ou ravette. **It.** Ravizzone. **Sp.** Nabina. **Port.** Semente de nabos, Nabaça. **Rus.** Rûpnoe semja. **Pol.** Rzepnica,) is the seed of the *napus sativa*, or long-rooted, narrow-leaved *rapa*, called in English navew, and reckoned by Linnaeus among the *brassicas* or cabbage-kind. This plant is cultivated in many parts of England to great advantage, particularly in Lincolnshire and Cambridgeshire, on account of the rape-oil expressed from its seeds. The cultivation of it was first introduced by those Germans and Dutch, who drained the fens of Lincolnshire; and hence the notion has erroneously prevailed, that it will only thrive in marshy soil. It is to be sown about midsummer. In the months of January, February, and March, it affords very good food for cattle, and will sprout again when cut; after which it is excellent nourishment for sheep, and after all, if not too closely fed, will bear seed against July. Large quantities of rape-seed were imported annually, from Flanders, Holland, and Germany; also from Champagne and Normandy, for the purpose of extracting rape-oil.

RAPE-OIL, (**GER.** Rübol. **Du.** Raapöl. **DA.** Roefölje. **Sw.** Rofölja. **Fr.** Huile de navette. **It.** Olio di ravizzone. **Sp.** Aceite de nabina. **Port.** Oleo de nabaça. **Rus.** Rûpnoe masslo,) is expressed from the rape-seed: it is used in the manufacture of wool, for burning in lamps, and to serve instead of train-oil, when there is a scarcity of the latter. Its good qualities are, a gold colour, an agreeable smell, and a sweet taste. It is sometimes mixed with linseed oil; but this adulteration is discoverable by its bitterness, and a less agreeable smell. The seeds from which rape-oil has been extracted are usually made up in lumps, and constitute what is called rape-seed cake. This, like linseed-cake, is esteemed good fodder for cattle, but it generally gives their flesh a rancid, oily flavour, and their fat a disagreeable gold colour.

RAPE, denotes the stalks of a vine-tree. They are used in making vinegar, being first put into a place to sour, before they are cast into the vinegar vessel. The only way of keeping rape is to fill the vessel wherein it is contained with wine, or vinegar.

RAPEN, a Swiss copper coin, equivalent to one twenty-fourth of a penny sterling.

RASPS, (**GER.** Raspehn. **Du.** Raspen. **DA.** and **Sw.** Rasper. **Fr.** Rapes. **It.** Raspe. **Sp.** Raspas, Raspadores. **Port.** Raspadores. **Rus.** Terpugii. **Pol.** Rasply,) large rough files, of various forms, according to the different uses to which they are put. They are generally constructed with wooden handles, and are manufactured, for the most part, at Sheffield, Birmingham, and Wolverhampton. Bakers, farriers, and carpenters, are those who principally employ rasps.

RASURE, or **ERASURE** of a deed, so as to alter it in a material part, without the consent of the party bound by it, &c. will make the same void; and if it be erased in the date after the delivery, it will make the whole void.

RATAFIA, a fine spiritous liquor, prepared from kernels, &c. of several kinds of fruit, particularly cherries, and apricots, with an addition of spice and brandy. Ratafia is chiefly prepared by the French, with whom it makes an article of commerce. It is sold in chests of six or eight bottles, with other liqueurs.

RATCH, or **RASH,** in clock-making, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, and make the clock strike.

RATCHES, in a watch, are the small teeth at the bottom of the fusee, or barrel, which stop it in winding up.

RATE, a standard or proportion, by which either the quantity or value of a thing is adjusted.

RATE, a valuation of every man's estate; or the appointing and setting down how much every one shall pay, or be charged with any tax. 55 Edw. 2.

Thus, a church-rate, a poor-rate, or a highway-rate, are the proportions which each person comprehended in it is respectively required to pay, for the particular object of it, with reference, in some way or other, to his local property.

RATE of a Ship of War, is its order, degree, or distinction, as to magnitude, burthen, &c.; and this is usually accounted by the length, and breadth, of the gun-decks, the number of guns they contain, and the number of men the ship carries.

The following are the descriptions of the different vessels of war, as rated in the British navy.

	Length of gun-decks.	Breadth of gun-decks.	Number of tons.	Number of men.	Number of guns.
First rate	159 to 174 ft.	14 to 50 ft.	1714 to 1920	750 to 850	96 to 120
Second ditto	153 to 165	41 to 46	1200 to 1600	660 to 750	84 to 90
Third ditto	142 to 158	37 to 42	1100 to 1224	410 to 480	64 to 80
Fourth ditto	118 to 146	29 to 38	711 to 1068	340 to 400	48 to 60
Fifth ditto	100 to 120	29 to 31	550 to 678	210 to 250	26 to 44
Sixth ditto	87 to 95	22 to 25	216 to 450	120 to 150	16 to 24

RATEEN, or **RATTEN**, (GER. *Ratin*. Du. *Ratyn*. DA. and Sw. *Ratin*. FR. *Ratine*. IT. *Ratino*. SP. and PORT. *Ratina*.) a thick woollen stuff, quilled and woven on a loom with four treddles, similar to serges and other stuffs, which have the whale on quilling.

Some rateens are dressed and prepared like cloths; others are left simply in the hair, and there are others where the hair or knap is friezed.

Rateens are principally manufactured in France, Holland, and Italy, and are mostly used in linings. The frieze is a species of coarse rateen, and the drugget a rateen half linen, and half woollen.

RATEL, or **RATTEL**, a Persian weight, six of which make a batman. The ratel is a trifle less than the Parisian pound. See **BATMAN**.

RATIS, a weight used for diamonds, at the mine of Soumelpour, in the kingdom of Bengal; and in all the late empire of the Grand Mogul, for diamonds, or pearls. It is seven-eighths of a carat, or three grains and a half.

RAT-LINES, or, as the seamen call them, **RATLINS**, are those lines which make the ladder-steps to get up the shrouds and futtock, hence called the ratlins of the shrouds.

RAT'S BANE. See **ARSENIC**.

RATTANS, or **RATANS**, (GER. *Rottings*. Du. *Rottingen*. DA. *Rottinge*. Sw. *Rottingar*. FR. *Rotins*, *Ratans*. IT. *Canne*, *e cannette di India*. SP. *Bejuquillos*. PORT. *Canços de India*.) are the small shoots or branches of the sugar-cane, brought to us from the East, and West Indies. When polished and mounted, they are used as walking sticks. See **BAMBOO**.

RAZORS, (GER. *Rasiermesser*, *Scheermesser*. Du. *Scheermessen*. DA. *Rageknive*. Sw. *Rakknifvar*. FR. *Rasoirs*. IT. *Rasci*. SP. *Navajas de afeitar*. PORT. *Navalhas*. RUS. *Britvii*. POL. *Brzytwy*.) instruments too generally known to need any particular description. The best razors are those manufactured at London, and Sheffield; the razors of Birmingham being of a very inferior sort. We export razors to most parts of the European continent, as well as to Asia, and America, and, in very small quantities, to Africa. Old razor-blades are usually made into pen-knives, which are in great request.

REACH, in the sea-language, signifies the distance between any two points of land, lying nearly in a right line.

REAL, a Spanish money of account; it is also a money of account at Leghorn, and in the Ionian islands.

REALGAR, or **ROSALGAR**, (GER. *Rauschgelb*. Du. and DA. *Rusgeel*. Sw. *Rauschgelb*. FR. *Réalgar*, *Réagal*. IT. *Risigallo*. SP. *Rejalgar*. PORT. *Rosalgar*. RUS. *Krasnoi arsenik*. POL. *Sandaraka*. LAT. *Risigalium*.) generally called *redorpiment*, is

of two kinds, native and factitious. The native is dug out of the same mines with orpiment, being of a cinnabar-colour, and smelling like sulphur and garlic, when burned, and made up in solid brittle globes. The factitious kind is made of orpiment melted and boiled for some time in subliming vessels, by which the yellow flowers are raised to the upper part of the vessels, and the mass remaining at the bottom, being condensed by cold, becomes of a red colour like cinnabar; which, if exposed to a free air for a long time, becomes covered with a soluble efflorescence. This realgar is not to be confounded with the factitious red arsenic. See **ARSENIC**.

REAM. The ream of writing-paper consists of twenty quires; but the ream of printing-paper, or, as it is sometimes called, the *printer's ream*, extends to $21\frac{1}{2}$ quires, or 516 sheets. Two reams of paper make a *bundle*.

RE-ASSURANCE. Re-assurance may be said to be a contract, which the first assurer enters into, in order to relieve himself from those risks which he has incautiously undertaken, by throwing them upon other underwriters, who are called re-assurers.

The re-assurer is wholly unconnected with the original owner of the property assured; and as there is no obligation between them originally, so none is raised by the subsequent act of the first underwriter. The risks of the assurer from the object of the re-assurance, which is a new independent contract, not at all concerning the assured; who consequently can assume no power or authority with respect to it. — *Pothier*, tit. *Assurance*, No. 96.

Although such a contract seems perfectly fair and reasonable in itself, and might be productive of beneficial consequences to those concerned; yet, it was so much abused and turned to purposes so pernicious, that the legislature was obliged to interpose, and by a positive law to cut off all opportunity of practising those frauds in future, which were become enormous.

Accordingly, by the fourth section of the 19 Geo. 2. c. 37., it is enacted, "that it should not be lawful to make *re-assurance*, unless the assurer should be insolvent, become a bankrupt, or die; in either of which cases, such assurer, his executors, administrators, or assigns, might make re-assurance, to the amount before by him assured, provided it should be expressed in the policy to be re-assurance."

This act is worded in express terms, excluding every species of re-assurance, except in the three instances. But as it was held, that the first clause of the statute, prohibiting assurances, *interest or no interest*, did not extend to foreign ships; so it was argued, that re-assurances made here on the ships of foreigners did not fall within the act. This point came on to be considered in the court of King's Bench, in the year 1787, in the

form of a special case, stating that a re-assurance was made by the defendant on a *French vessel*, first assured by a *French underwriter* at Marseilles, who was living, and who, at the time of subscribing the second policy, was solvent.

The court (Ashurst, Buller, and Grose, justices) were unanimously of opinion, that this policy of re-assurance was void; and that every re-assurance in this country, either by British subjects or foreigners, on British or foreign ships, is void by the statute, *unless the first assurer be insolvent, become a bankrupt, or die.*—*Andrée v. Fletcher*, 2 Term Rep. 161. But if an underwriter transfer by parol to another, at a higher premium, his subscription to a policy, it is not such a re-assurance as is prohibited by the statute. — *Delver v. Barnes*, 1 Taunt. 48.

In France, as in other countries, it was formerly allowed to the insured to insure the solvency of the underwriter; but this practice is not allowed in England; and though no express notice is taken of it in the above statute, it seems that such policy would be looked upon as a wager-policy, and treated accordingly.

REBATE, is an allowance in the purchase of goods, for prompt payment.

RECAPTION. Where one has deprived another of his property, the owner may lawfully claim and retake it wherever he happens to find it, so that it shall be not in a riotous manner, or attended with any breach of the peace.

RECAPTURE. See **SALVAGE**.

Before the statute 19 Geo. 2. c. 37., which abolished wager-policies, the recapture had a considerable effect upon the contract of insurance, (2 Burr. 695. 1 Wils. 191. 2 Stra. 1250. Park, 73. 77.) and several cases were determined on that question. But now the contract is not at all altered between the underwriter and the insured by such an event. (2 Burr. 694.)

RECEIPTS, are acknowledgments in writing, of having received a sum of money or other value. A receipt is either a voucher for an obligation discharged, or one incurred.

By 55 Geo. 3. c. 55., every note, memorandum, or writing whatever, given to any person on the payment of money, acknowledging such payment, on whatever account it be; and whether signed or not, shall be considered a receipt, and liable to a stamp duty.

And every person who shall write, or cause to be written, any receipt for money on unstamped paper, (except in certain excepted cases hereafter enumerated,) or on a lower stamp than the proper one, shall forfeit 10*l.* if for a sum under 100*l.*; if above, 20*l.*

Giving receipts for less than actually paid, writing off sums, or other fraudulent contrivances whatsoever, 50*l.* 55 Geo. 3. c. 55.

(But, by the same act, s. 11., receipts may

be stamped if brought *within fourteen days after date*, on payment of a penalty of 5*l.* over and above the duty; and if brought *within one calendar month*, on payment of a penalty of 10*l.* and the duty.)

To be recovered before one justice, on the oath of one witness, or confession, within three months of the offence, or the offender to be committed to gaol for three calendar months; mitigable to half the penalty, beside costs, with appeal to the Sessions.

Witnesses refusing to attend or give evidence, to forfeit 40*s.* to be levied as other penalties.

By 44. Geo. 3. c. 98., prosecutions must be with the leave, and in the name of the attorney-general, or the solicitor or other officers of the stamp duties, who are authorised to give a portion of the penalties to the informers.

The commissioners of stamps may authorise unstamped books to be used in any *public* office, or the office of any corporation or company, on condition that the same are first signed by the commissioners; and the duties paid from time to time for all receipts written therein.

The duty shall be payable by every person *required* to give such receipt; and the person from whom any money shall be due, may provide the stamp, and require from the person entitled to such money, or any agent to whom the same shall be paid, a receipt for such money, and also the amount of the duty: and if any person to whom such money shall be paid, shall refuse to give such receipt upon demand, or pay the amount thereof, he shall forfeit 10*l.* 43 Geo. 3. c. 126.

And no receipt shall be good, useful, or available in law or equity, unless stamped with a stamp to denote the rate of the duty, or some higher rate of duty.

(By 55 Geo. 3. c. 108., the stamps are as follow:—

RECEIPT or Discharge, given for or upon the payment of money, amounting to 2 <i>l.</i> and not 5 <i>l.</i>	0	0	2
Amounting to 5 <i>l.</i> and not 10 <i>l.</i> ...	0	0	3
Amounting to 10 <i>l.</i> and not 20 <i>l.</i> ...	0	0	6
Amounting to 20 <i>l.</i> and not 50 <i>l.</i> ...	0	1	0
Amounting to 50 <i>l.</i> and not 100 <i>l.</i> ...	0	1	6
Amounting to 100 <i>l.</i> and not 200 <i>l.</i> ...	0	2	6
Amounting to 200 <i>l.</i> and not 300 <i>l.</i> ...	0	4	0
Amounting to 300 <i>l.</i> and not 500 <i>l.</i> ...	0	5	0
Amounting to 500 <i>l.</i> and not 1000 <i>l.</i> ...	0	7	6
Amounting to 1000 <i>l.</i> or upwards ...	0	10	0
And where any sum shall be therein expressed to be received in full of all demands	0	10	0

And any note, memorandum, or writing whatsoever, given to any person, for or upon the payment of money, whereby any sum of money, debt, or demand, or any part of any debt or demand, therein specified, and amounting to two pounds or upwards, shall be expressed or acknowledged to have been paid, settled, balanced, or otherwise dis-

charged or satisfied, or which shall import or signify any such acknowledgment, and whether the same shall, or shall not, be signed with the name of any person, shall be deemed and taken to be a receipt for a sum of money, of equal amount with the sum, debt, or demand, so expressed or acknowledged to have been paid, settled, balanced, or otherwise discharged or satisfied, within the intent and meaning of the act, and shall be charged with a duty accordingly.

And any receipt or discharge, note, memorandum, or writing whatever, given to any person for, or upon the payment of, money, which shall contain, import, or signify any general acknowledgment of any debt, account, claim, or demand, debts, accounts, claims, or demands, whereof the amount shall not be therein specified, having been paid, settled, balanced, or otherwise discharged or satisfied, or whereby any sum of money therein mentioned shall be acknowledged to be received, in full, or in discharge or satisfaction of any such debt, account, claim, or demand, debts, accounts, claims, or demands, and whether the same shall or shall not be signed with the name of any person, shall be deemed and taken to be a receipt for the sum of 500*l.* or upwards, within the intent and meaning of this schedule and of the foregoing act; and shall be charged with the duty of five shillings accordingly.

And all receipts, discharges, and acknowledgments of the description aforesaid, which shall be given for or upon payments made by or with any bills of exchange, drafts, promissory notes, or other securities for money, shall be deemed and taken to be receipts given upon the payment of money, within the intent and meaning of the act.

Exemptions from the preceding Duties on Receipts.

Receipts exempted from stamp duty by any act relating to the assessed taxes:

Receipts or discharges given by the treasurer of the navy, for the service of the navy:

Receipts or discharges given by any agent, on account of the pay of the army or ordnance:

Receipts or discharges given by any officer, seaman, marine, or soldier, or their representatives respectively, for or on account of any wages, pay, or pension, due from the navy office, army pay office, or ordnance office:

Receipts or discharges given for the consideration money, for the purchase of any share in any of the government parliamentary stocks or funds; or in the stocks and funds of the governor and company of the bank of England, or of the East-India company, or South-Sea company, and for any dividend paid on any share of the said stocks or funds respectively:

Receipts given for money, deposited in the bank of England, or in the bank of Scotland, or the royal bank of Scotland, or in the bank

of the British linen company in Scotland, or in the hands of any banker or bankers, to be accounted for on demand; provided the same be not expressed to be received of, or by the hands of any other than the person or persons to whom the same is to be accounted for, — and not with interest.

Receipts or discharges, written on promissory notes, bills of exchange, drafts, or orders for the payment of money, duly stamped, according to the laws in force at the date thereof; or upon bills of exchange drawn out of, but payable in Great Britain:

Receipts or discharges, given upon bills or notes of the governor and company of the bank of England:

Letters by the general post, acknowledging the safe arrival of any bills of exchange, promissory notes, or other securities for money:

Receipts or discharges, endorsed or otherwise written upon, or contained in, any bond, mortgage, or other security, or any conveyance, deed, or instrument whatever, duly stamped, according to the laws in force at the date thereof, acknowledging the receipt of the consideration money therein expressed, or the receipt of any principal money, interest, or annuity, thereby secured:

Releases or discharges for money, by deeds duly stamped according to the laws in force at the date thereof:

Receipts or discharges given for drawbacks or bounties, upon the exportation of any goods or merchandize from Great Britain:

Receipts or discharges for the return of any duties of customs, upon certificates of over entry:

Receipts, or acknowledgments of payment, indorsed upon any bills, orders, remittance-bills, or remittance-certificates, drawn by commissioned officers, masters, and surgeons in the navy, or by any commissioner or commissioners of the navy, under the authority of an act passed in the 35th year of his majesty.

Receipts, or acknowledgments of payment, indorsed upon any bills, drawn pursuant to any former act or acts of parliament, by the commissioners of the navy, of the transport service, of the sick and wounded, and payable by the treasurer of the navy.

RECEIVER. Receiving stolen goods, knowing them to be stolen, is a high misdemeanor at the common law; and by several statutes is made felony, and liable to transportation.

Thus by 5 Ann. c. 31., although the principal in a felony cannot be taken, yet the receiver of the stolen property may be convicted and punished by fine and imprisonment. And by 22 Geo. 2. c. 58., the former statute was extended to all cases whatever; and it has been determined, under this latter statute, that even the principal may be a witness against the receiver, and such is the constant practice.

By 29 Geo. 2. c. 30., amended by 21 Geo. 3.

c. 69., and further extended by 22 Geo. 3. c. 58. receivers of lead, iron, copper, brass, bell-metal, and solder, stolen from houses, shops, warehouses, mills, ships, and other vessels, wharfs, quays, &c. are subject to transportation.

By 3 Geo. 4. c. 24. these acts are extended to receivers of stolen bonds, bank-notes, and other securities for money.

And by s. 3. of the same act, offenders against these statutes may be convicted, whether before or after the conviction of the principal offender.

RECKONING, or a ship's reckoning, in navigation, is that account by which at any time it may be known where the ship is, and on what course or courses she is to steer in order to gain her port; and that account taken from the log-board, is called the dead reckoning.

RECOGNIZANCE. A bond or obligation of record, acknowledged before a proper authority to the use of the king. These records testify that the obligor owes a certain sum of money inserted therein, if some certain act therein mentioned shall not be performed; viz. if some person shall not appear in some court of justice at a particular time; if he shall not keep the peace for a certain period; or if he shall not pay a certain debt, and the like. *2 Black. Com. 541.*

RECORD, is an authentic testimony of any thing reduced into writing on parchment, and preserved in some court or public office for the reception of such instruments. There are reckoned three descriptions of records — judicial, ministerial, and by consent and conveyance. Hence the term *recorder*, which signifies that person who is appointed to assist the principal (under whatever title such principal be recognized) of a corporate body, which has by its charter of institution a court of record appertaining to it.

Debts of record are such as appear to be due by the record of a court. Thus recognizances, together with statutes *merchant*, and statutes *staple*, if forfeited by non-performance of the condition, are debts of record. — *2 Black. Com. 160.*

RECOVERY. In its legal and mercantile application generally signifies the actual re-possession of something taken away, or the acquisition of the value thereof, through the medium of some legal proceeding. But it also signifies technically a process of law in the court of common pleas, whereby a man may, under certain circumstances, destroy entails of estates, and bar those in remainder and reversion from inheriting. — *2 Black. Com. 116.*

RECTIFIED SPIRITS are such spirituous liquors as have undergone the process of rectification, or are freed from their phlegm. *See DISTILLATION.*

RECTIFIER, in navigation, an instrument consisting of two parts, which are two circles, either laid one upon, or let into the other, and so fastened together in their cen-

res, that they represent two compasses, the one fixed, the other moveable; each of them divided into the thirty-two points of the compass, and three hundred and sixty degrees, and numbered both ways, both from the north and the south, ending at the east and west in ninety degrees. The fixed compass represents the horizon, in which the north and all the other points of the compass are immoveable. The moveable compass represents the mariner's compass, in which all the points are liable to variation. In the centre of the moveable compass is fastened a silken string, long enough to reach the outside of the fixed compass. But if the instrument be made of wood, there is an index in lieu of the thread. Its use is to find the variation of the compass, and to rectify the course at sea, having the amplitude of azimuth given.

RED, in dyeing, is one of the five simple, or mother colours. *See DYEING.*

RED, among painters, one of the primary colours. *See COLOUR and PAINTING.*

REDDLE, an ore of iron in the state of red oxide, commonly used as a pigment. Red lead pencils, as they are vulgarly called, are made of this substance, which is likewise much used in marking sheep, and other coarse purposes.

RED-EARTH, (*GER. Rothe Erde. DU. Roodaarde. DA. and Sw. Rödjord. FR. Terre rouge. IT. Terra rossa. SP. Tierra roja. PORT. Terra roxa. RUS. Krasnoi zwet.*) a reddish soil approaching to a brown colour, found in many parts of Great Britain, and in great abundance in France. It is used as a pigment.

RED-HERRINGS. (*GER. Bücklinge. DU. Bokkingen. DA. Bökling. SW. Bökling, Røkt sill. FR. Hareng sor, Hareng enfumé, Hareng rouge salé. IT. Aringa secca, infumata, passa. SP. Arenque secado, ahumado. PORT. Arenque secco, curado. RUS. Koptschenaja seld. POL. Sledz wedzony.*) In curing red herrings, they lay them in brine, as the pickled or white herring: only they let them lie therein double the time (24 or 30 hours), because they are now to take all their salt, whereas the other kind takes half its salt in the barrel. When taken out of the brine, they string them by the head on little wooden spits, and thus hang them in a kind of chimney, made for the purpose, exposing them to the smoke of brushwood, until sufficiently smoked and dried, which commonly takes 24 hours. The goodness of red-herrings consists in their being large, fresh, fat, oily, soft, and pliable; their outside of a yellow gold colour; their roes or milts within them, and their being well salted, smoked, and barrelled. *See FISHERY and HERRINGS.*

RED LEAD, *See MINUM and LEAD.*

RED OCHRE, **BROWN RED**, or **SPANISH RED**, (*GER. Braunroth. DU. Bruinrood. DA. Bruunrødt. SW. Brunröd. FR.*

Bran rouge, Rouge brun. It. *Rosso bruno.* Sp. *Almagre colorado, Almazarron.* Port. *Almagre, Almagra,*) is produced by subjecting the species of earth called yellow ochre, to the action of fire, till it becomes perfectly red or nearly brown. Red ochre is much used by painters, and is esteemed a good standing colour: England and Italy are the parts of Europe most noted for the exportation of red ochre.

RED ORPIMENT. See REALGAR.
RED SAUNDERS, See SAUNDERS.

REDUCTION, in arithmetic, the method of converting numbers from one name or denomination, to another series. It is divided into *Reduction Descending*, and *Reduction Ascending*. — See *Joyce's Arithmetic*.

REE, REI, REIZ, or REZ, a small Portuguese copper coin, equivalent to 1-24th of a penny sterling.

REED. (GER. *Rohr.* Du. *Riet.* Da. and Sw. *Rör.* Fr. *Roseau.* It. *Canna.* Sp. *Cana.* Port. *Cana.* Rus. *Trost.* Pol. *Troina.* Lat. *Arundo.*) The chief species of reeds, of any importance in a commercial point of view, are the following: 1. The *arundo donax*, or cultivated reed, a native of warm countries, yet it will bear the cold of our winters in the open air. The stalks of this are brought from Spain and Portugal, and are used by weavers, and also for making fishing-rods. 2. The *arundo orientalis*, or oriental reed, which the Turks use as writing-pens; it grows in a valley near Mount Athos, as also on the banks of the river Jordan. 3. *Arundo versicolor*, or Indian variegated reed; supposed to be a variety of the *donax*, differing from it only in having variegated leaves. The BAMBOO (which see) is likewise a species of reed.

REEF, a term in navigation. When there is a great gale of wind, they commonly roll up part of the sail below, that by this means it may become the narrower, and not draw so much wind; which contracting or taking up the sail, they call a *reef*, or *reefing* the sail. So also when a top-mast is sprung, that is, when it is cracked, or almost broken in the cap, they cut off the lower piece that was nearly broken off, and setting the other part, now much shorter, in the step again, they call it a *reefed top-mast*.

REEL, (*Reels.* GER. *Haspeln.* Du. *Haspels.* Da. *Hasper.* Sw. *Hasplar, Härflar.* Fr. *Dévidoirs.* It. *Naspi, Naspoli, Aspi.* Sp. *Argadillos.* Port. *Devanaderas.* Rus. *Motowila.* Pol. *Motowidła,*) in the manufactories. There are various kinds of reels, some very simple, others as complex. Of the former kinds, those most in use are: 1. A reel held in the hand, consisting of three pieces of wood, the biggest and longest whereof, (which does not exceed a foot and a half in length, and a quarter of an inch in diameter) is traversed by two other pieces

disposed different ways. 2. The common reel, or windlass, which turns upon a pivot, and has four flights traversed by long pins or sticks, whereon the skein to be reeled is put, and which are drawn closer, or opened wider, according to the skein.

REEVING, in the sea language, the putting a rope through a block; hence to pull a rope out of a block is called *unreeving*.

RE-EXCHANGE, or RE-CHANGE, a second payment of the price of exchange, or rather, the price of a new exchange, due upon a bill of exchange that comes to be protested, and must be refunded to the bearer by the drawer or endorser. The occasion of re-exchange is when the bearer of a bill of exchange, after protesting it, for want either of acceptance or payment, borrows money on his own bond, promise, or the like; or draws a bill of exchange in the place where the payment was to be made, on the person who furnished the first; for which he pays a second exchange, which being added to the first already paid, the drawer of the first bill makes two exchanges, properly called exchange, and re-exchange. The bearer of a protested bill has a right to recover both the one and the other on the drawer; yet the simple protestation the bearer makes in the act of protest, that he will take up a like sum at re-exchange, for want of his bill being accepted or paid, is not sufficient to entitle him to demand the reimbursement of his re-exchange, unless he make it appear he has actually taken up money in the place whereon the bill was drawn, otherwise the re-exchange will amount to the restitution of the first exchange, with interest, the expenses of protesting, and of the journey, if there have been any. If a bill of exchange, payable to the bearer, or order, come to be protested, the re-exchange is only due upon the drawer for the place where the remittance was made; not for those places where it may have been negotiated; at least the drawer has a right to be refunded his re-exchange, for those places by the indorser. Indeed the re-exchange is due from the drawer, upon all places, where a power of negotiation is given by the bill, and upon all others, if the power of negotiation be indefinite. Lastly, the interest of the re-exchange of the expenses of the protest, and the journey, are only due from the day of the demand. See BILLS OF EXCHANGE.

REFE, a long measure used at Madagascar, being nearly equal to what is called the *brasse* in Europe. They also use the *demi-refe*, or span.

REFINING, in general, is the art of purifying a thing, including not only the assaying or refining of metals, but likewise the depuration or clarification of oils, &c. Gold and silver may be refined by several methods, which are all founded on the essential pro-

perties of these metals, and acquire different names according to their kinds. Thus, for instance, gold having the property which no other metal, not even silver, has, of resisting the action of sulphur, of antimony, of nitrous acid, of marine acid, may be purified by these agents from all other metallic substances, and consequently may be refined. These operations are distinguished by proper names, as purification of gold by antimony, parting, concentrated parting, dry parting. In a similar manner, as silver has the property (which the imperfect metals have not) of resisting the action of nitre, it may be refined by this salt; but the term refining is chiefly applied to the purification of gold, and silver, by lead, in the cupel. This is performed by the destruction, vitrification, and scorification, of all the extraneous and destructible metallic substances with which they are allayed.

As none but the perfect metals can resist the combined action of air and fire, without losing their inflammable principle, and being changed into earthly or vitreous matters, incapable of remaining any longer united with substances in a metallic state, there is then a possibility of purifying gold, and silver, from all alloy of imperfect metals, merely by the action of fire, and air, only by keeping them fused till all the alloy is destroyed; but this purification being too expensive, and tedious, a much shorter, and more advantageous, method has been discovered. This consists in adding to the allayed gold, and silver, a certain quantity of lead, and exposing afterwards this mixture to the action of the fire. Lead is one of the metals which loses most quickly, and easily, a sufficient quantity of its inflammable principle to cease to be in a metallic state; but, at the same time, this metal has the remarkable property of retaining, notwithstanding the action of the fire, enough of this same inflammable principle, to be very easily melted into a vitrified, and powerfully vitrifying, matter, called litharge.

The lead, then, which is to be added to the gold, and silver, to be refined, or which happens naturally to be mixed with these metals, produces, in their refining, the following advantages: 1. By increasing the proportion of imperfect metals, it prevents them from being so well covered and protected by the perfect metals. 2. By uniting with these imperfect metals, it communicates to them a property it has of losing very easily a great part of its inflammable principle. 3. By its vitrifying and fusing property, which it exercises with all its force upon the calcined, and naturally refractory, parts of the other metals, it facilitates and accelerates the fusion, the scorification, and the separation of these metals.

The lead, which in this operation is scorified, and scorifies along with it the imperfect metals, separates from the metallic mass, with which it is then incapable of remaining

united, and floats upon the surface of the melted mass, and lastly it vitrifies.

The removal of this vitrified matter, is effected either by the nature of the vessel, in which the melted matter is contained, and which, being porous, absorbs and imbibes the scorified matter as fast as it is formed; or by a channel cut in the edge of the vessel, through which the matter flows out.

The vessel, in which the refining is performed, is flat and shallow, that the matter which it contains may present to the air the greatest surface possible. The furnace ought to be vaulted, that the heat may be applied upon the surface of the metal during the whole time of the operation. In the instant when all the imperfect metal is destroyed, and consequently the scorification ceases, the surface of the perfect metals is seen, and appears clean and brilliant. This forms a kind of fulguration or coruscation: by this mark the metal is known to be refined. If the operation be so conducted, that the metal sustains only the precise degree of heat necessary to keep it fused before it is perfectly refined, we may observe that it fixes or becomes solid all at once in the very instant of the coruscation; because a greater heat is required to keep silver, or gold, in fusion when they are pure, than when allayed with lead.

The operation of refining may be performed in small, or in large, quantities, upon the same principles, but only with some differences in the management. As the refining of small quantities of perfect metals is performed in the same manner as these metals are assayed, the assay being only a very accurate refining, we refer to the article ASSAYING.

As we have already observed, the term *refining* is not confined to the purifying of metals alone, but extends to the depuration of liquors.

Whites of eggs, and isinglass, are the articles chiefly used for this purpose. When the whites of eggs are made use of, it is necessary to be particularly careful in using the freshest eggs only; and in examining them, great caution is to be observed, since it has often happened, that a single egg, however slightly tainted, has given a disagreeable flavour to a whole pipe of wine. It is best to employ such eggs only as are laid by hens which do not associate with cocks, because the intercourse of the male renders the eggs more liable to putrescence, and gives them a very bad taste. Isinglass does not alter the true colour of the wine, or communicate a disagreeable flavour to it, and is therefore best.

Experience has proved, that white wines in particular, which have been clarified through the medium of isinglass, are more transparent, and preserve their limpidness much longer, than those to which the whites

of eggs have been applied; the latter being invariably injured by a contact with the atmospheric air. As to red wines, a very small portion of isinglass will clear them perfectly.

It was suggested by Parmentier, a French chemist, that, in many cases, a sort of jelly, prepared from the raspings of bones, might be substituted for isinglass; and some persons have thought, that a gelatinous substance, both wholesome, and pleasing to the smell and taste, might be prepared for the purpose already mentioned, from fresh-water fish, as those kind which are nearly without scales are known to abound in this matter, and thus the importation of isinglass might be superseded.

REFUNDING, is the paying back of money given, as a consideration for any contract that has not been fulfilled. If a person take an apprentice, and receive a premium, and die before the end of the term, his executors are bound to pay back a proportionate part of the premium, after deducting for the maintenance of the apprentice.

A, an attorney, lying ill of the sickness of which he afterwards died, takes B for his clerk, and receives one hundred and twenty pounds, and by articles agrees with the father of B to return sixty pounds of the money, if he died within a year. A died within three weeks. The executor of A was decreed to pay back *one hundred guineas*. — *Ver. 466. pl. 456. Trin. 1687. Newton v. Rouse.*

A was indebted to B in four hundred pounds, by mortgage. B died, and C his executor, (on a bill in chancery, for the payment of debts of A, out of lands, charged with the same,) received, in virtue of the master's report, the sum of seven hundred pounds. It afterwards appeared that three hundred and odd pounds had been paid to B in his life-time; and, on a new application to the court, the executor C was obliged to refund this sum to the rightful heir of A. — *Wms.'s Rep. 355. Trin. 1717. Foley v. Ray.*

Mich. 30 Car. 2. Master had received with apprentice 250*l.* died in two years, the apprentice during that time not having learned his trade. Decreed that executor should return the premium, deducting 20*l.* per ann. for board. See *Dick. Pract. Expos. 95., and Chitty on App. 75.*

If an executor pays a debt on a simple contract, there shall be no refunding to a creditor of a higher nature. — 2 *Vent. 360. Pasch. 35 Car. 2. Hodges v. Waddington.*

REFUSAL, is where a person hath, by law, a right and power of having or doing something of advantage to him, which is refused. An executor may refuse an executorship; but the refusal ought to be before the ordinary. If an executor be summoned to accept or refuse the executorship, and he doth not appear upon the summons,

and prove the will, the court may grant administration, &c., which shall be good in law till such executor hath proved the will; but no man can be compelled to take upon him the executorship, unless he hath meddled with the estate.

REGISTER SHIPS, are such vessels as the government, on certain conditions hereafter specified, admits to all the rights enjoyed by British-built ships, thereby permitting them to trade to, and from, the ports in amity with, or appertaining to, Great Britain, and granting them those immunities extended to the British flag, with protection in the aforesaid ports, as well as at sea, when circumstances allow of its being afforded.

The following is an abstract of the statute 26 Geo. 3. c. 60., which contains the regulations now in force with respect to register ships, but so far extended by 27 Geo. 3. c. 19.; that by sect. 12. it is declared that "all vessels which by such act of 26th are declared not to be entitled to any of the advantages of a British-built ship, or of a ship owned by British subjects, and all ships not registered according to the said act, shall, although such ships may be owned by his majesty's subjects, be deemed as alien ships, and be in all cases liable to the same penalties.

And by 54 Geo. 3. c. 59., all vessels, whether British or foreign, which shall become forfeited under any act for the abolition of the slave-trade, and be condemned, shall from such condemnation be entitled to a certificate of registry as a British-built ship, and enjoy all privileges as such, in like manner as vessels taken by his majesty's ships of war, and condemned as lawful prize; provided they shall be subject to the same conditions, and forfeitures, and be owned and navigated in like manner, as such prizes are required to be.

Every ship or vessel having a deck, or being of the burthen of fifteen tons, and belonging to a subject in Great Britain, Guernsey, Jersey, the Isle of Man, or any colony, plantation, island, or territory, belonging to the king, is to be registered by the person claiming a property therein, who is to obtain a certificate of such registry in the form given in the act, from the collector and comptroller, if in Great Britain or the Isle of Man, or from the governor, lieutenant-governor, or commander in chief, and the principal officers of the customs, if in Guernsey, &c.

Such certificate is not to be granted but in the port to which the ship properly belongs, except prize-ships condemned in Guernsey, Jersey, or Man, which are to be registered in a particular manner; and except cases where the officers are specially authorised by the commissioners of the customs.

The port to which a ship shall be deemed to belong, is the port from, and to, which she

usually trades, or, being a new ship, shall intend to trade, and at or near which the husband, or acting and managing owner, usually resides.

No ship, the property of the king or royal family, nor any lighters, barges, boats, or vessels, of any build or description whatever, used solely in rivers or inland navigation, need be registered.

No ship built in the United States of America, or owned by the people thereof, during the time the prohibitory acts are in force, and not before registered, is entitled to be registered, unless it has been condemned as a prize, or stranded and built, or rebuilt.

No subject, whose usual residence is out of the king's dominions, shall, during such residence, be entitled to be owner, in whole or in part, of a British ship to be registered under this act, unless he is a member of some British factory, or agent for, or partner in, any house or co-partnership, actually carrying on trade in Great Britain or Ireland.

The oath (*given at the foot of this article*) is to be taken by the owner, and if there are two joint-owners, by both, if they live within twenty miles of the port, otherwise by one : if more than two, then by the greater part not exceeding three, if so many are resident within twenty miles of the port ; if not, by one.

That the proper officers may be ascertained of the ships registered, one or more persons are to be appointed by the commissioners of customs, in England and Scotland, and by the governors in the plantations, &c. for examining and admeasuring ships, as to the particulars contained in the certificate ; and he is to deliver an account thereof to the person who is to make the registry, and grant the certificate. Some person attending on the owner's part is also to sign his name to the certificate of such surveying officer, if he agrees to the contents of the account.

If such officer gives false descriptions, or any person makes a false register, or grants a false certificate, he is to forfeit 100*l*.

A bond is entered into by the master and owners, at the time of obtaining the certificate, that the said certificate shall not be sold, lent, or otherwise disposed of ; and that in case the ship be lost, taken, or the like, the certificate, if preserved, shall be returned, within one month after the master's arrival in the king's dominions, to the collector or comptroller of some port of Great Britain, or the Isle of Man, or of the plantations, &c. ; and that if any foreigner shall become entitled to the whole or any share in the interest in the ship, the certificate shall be delivered up within seven days after such transfer of property, if it shall be within the limits of the king's dominions ; and, if any foreign port, to the British consul resident there ; and if at sea, to the con-

sul or British officer at the first port where the ship shall arrive, immediately after arrival : or if the port at which it arrives is in Great Britain, &c. then within fourteen days after arrival.

If any alteration of property takes place, in the same port in which the ship was originally registered, such alteration to be acknowledged by indorsement on the certificate, before two witnesses, together with the town, place, or parish, where the person resides to whom the transfer is made ; or if he lives in some British factory, the name thereof ; if in some foreign town, and he is not a member of a British factory, the name of the town, and also the name of the house or co-partnership in Great Britain or Ireland, whose agent or partner he is ; and the person to whom the transfer is made, is to deliver a copy of such indorsement to the person authorised, to make registry, and grant certificates, who is to cause an entry thereof to be indorsed on the oath upon which the original certificate of registry was obtained, to make a memorandum of it in the Book of Registers, and give notice thereof to the commissioners of customs in England or Scotland under whom they act.

So often as the property of a ship is transferred from one British subject to another, in the whole, or in part, the certificate of the registry is to be recited in the bill of sale, which is otherwise void. So often as the master is changed, the certificate is to be delivered by the master or owner, at the port where the change is made, to the person authorized there to grant certificates, who is to indorse and subscribe a memorandum of such change, &c.

Owners not to change the name by which a ship was first registered ; and they are within a month after the first registering to paint on some conspicuous part of the stern, in letters four inches long, the name of the ship ; and any owner or master, obliterating or concealing the name so painted (unless in square-rigged vessels in time of war), or in any paper describing a ship by any other name than that she was registered by, or verbally so describing her to the officer of the customs, forfeits 100*l*.

Persons applying for registry for any ship built after 1st August, 1786, are to produce a true account under the builder's hand, of the time and place of building, tonnage, and the name of the first purchaser, and make oath that the ship in question is the same.

If a certificate be lost or mislaid, a registry or certificate *de novo* may be granted, according to the regulations of stat. 15 G. 2. c. 51. provided the above-required security be given ; and the oath prescribed by this act be taken, instead of that prescribed by act of 15 Geo. 2.

If a ship, after registering, shall be altered in form, or burthen, she must be registered *de novo*, as soon as she returns to the port to

which she belongs, or to any other port where she may be legally registered.

The owners of prize-ships, before registering, to produce a certificate of the condemnation, under the hand and seal of the judge, and also an account of the particulars contained in the before-mentioned certificate, to be made and subscribed by persons appointed to survey the ship. See PRIZE-SHIPS.

Certificates to distinguish ships in two ways, either by being intituled, "Certificate of British Plantation Registry;" or "Certificate of Foreign Ships' Registry for the European Trade, British Property."

No ship to be allowed to clear out as a British ship, or to be entitled in any wise to the privileges of a British ship, unless the owner had obtained a certificate.

The masters of ships are, on demand, to produce their certificates to the principal officer in any port of his majesty's dominions; or to the British consul or chief officer in any foreign port, under a penalty of 100*l*.

The fees of registry are specially limited by the act. See sec. 37.

Lastly, all former acts made for the registry of ships, shall be taken to extend to ships required by this act to be registered.

The other acts which relate to the registering of ships, are the 7 & 8 Will. 3. and the 15 Geo. 2. such of their contents as are now in force are contained in our brief abstract of the latest act passed upon this important article of maritime law. We have therefore only to add a mere note or two, from modern cases, which apply to the general principles contained in these statutes.

The ship register statutes do not apply to a transfer of property by operation of law, such as from the commissioners to the assignees of a bankrupt. *Bloxham v. Hubbard*. 5 E. R. 407.

Under the ship-register acts, in order to make a title to a ship sold at sea, whether in whole or in part, such sale must be acknowledged by proper indorsement of her certificate of registry; and a copy of such indorsement must be delivered by the vendee to the persons authorised to make registry; and it is not sufficient for such vendee to register such ship *de novo*, in another port where he resides, though he remove the ship there, and she do never more return to her original port after the sale. *Ibid*.

A foreign-built ship, British owned, is not required to be registered. *Long v. Duff*. 2 B. & P. 209.

Form of the Oath to be taken (as directed by Stat. 26 Geo. 3. c. 60.) in order to making a Registry, and granting a Certificate thereof.

I, A. B. of (place of residence and occupation), do make oath that the ship or vessel (name), of (port or place), whereof (master's name) is at present master, being (kind of build, burthen, &c. as described in

the surveying officer's certificate) was (when and where built, or if prize, capture and condemnation); and that I, the said A. B. (and the owner's names and occupations, and where they respectively reside, viz. town, place, or parish, and county; or if member thereof, and resident in, any factory in foreign parts, or in any foreign town or city, being an agent for, or partner in, any house or co-partnership actually carrying on trade in Great Britain or Ireland, the name of such factory, foreign town, or city; and the names of such house or co-partnership), am (or are) sole owner (or owners) of the said vessel; and that no other person or persons whatever hath or have any right, title, interest, share, or property, therein or thereto; and that I, the said A. B. (and the said other owners, if any) am (or are) truly and *bonâ fide* a subject (or subjects) of Great Britain: and that I, the said A. B. have not (nor have any other of the owners, to the best of my knowledge and belief) taken the oath of allegiance to any foreign state whatever, (except under the terms of some capitulation, describing the particulars thereof,) or that since my taking (or his or their taking) the oath of allegiance, (naming the foreign states respectively to which he or any of the said owners shall have taken the same,) and prior to the passing of an act in the twenty-sixth year of the reign of king George the Third, (intituled "An Act for the further Increase and Encouragement of Shipping and Navigation;") I have (or he or they hath or have) become a subject (or subjects) of Great Britain, (either by his majesty's letters patent, as a denizen or denizens, or naturalized by act of parliament, as the case may be, naming the dates of the letters of denization, or the act or acts of parliament for naturalization respectively,) or (as the case may be) I have (or he or they hath or have) become a denizen (or denizens, or naturalized subject or subjects, as the case may be) of Great Britain, by his majesty's letters patent, or by an act of parliament, passed since the first day of January, one thousand seven hundred and eighty-six, (naming the times when such letters of denization have been granted respectively, or the year or years in which such act or acts for naturalization have passed, respectively,) and that no foreigner, directly or indirectly, hath any share, or part, or interest in the said ship or vessel.

Form of a Certificate of Registry, directed to be granted by Stat. 26 Geo. 3. c. 60.

In pursuance of an act passed in the twenty-sixth year of the reign of king George the Third, intituled, "An Act"—(here insert the title of the act, the names, occupation, and residence of the subscribing owners,) having taken and subscribed the oath required by this act, and having sworn that he (or they) together with (names, oc-

cupation, and residence of non-subscribing owners), is (or are) sole owner (or owners) of the ship or vessel called (name of ship), (of place to which the vessel belongs), whereof (master's name) is at present master, and that the said ship or vessel was (when and where built, or captured, and date of condemnation;) and (name and employment of surveying officer) having certified to us that the said ship or vessel is (whether British, foreign, or British-plantation-built), has (number of decks) decks, and (number of masts) masts, that her length, from the fore-part of the main stem, to the after-part of the stern-post aloft, is (number of feet and inches); her breadth, at the broadest part, whether above or below the main-wales (number of feet and inches); her height between decks (number of feet and inches, if more than one deck, and if not, then) the depth of the hold, (number of feet and inches); and admeasures (burthen) tons, that she is (kind of vessel, and how built), has (whether any or no gallery), and (kind of head, if any) head; and the said subscribing owners having consented and agreed to the above description and admeasurements, and having caused sufficient security to be given, as is required by the said act, the said (kind and name of the vessel) has been duly registered at the port of (name of the port).

Given under our hands and seals of office, at the custom-house in the said port of (name), this (date) day of (month,) in the year (words at length.)

REGISTER-SHIPS, in the Spanish trade, are vessels which obtain a permission from the king of Spain, or the council of the Indies, to traffic in the ports of the Spanish West Indies, which are thus called from their being registered before they set sail from Cadiz.

REGISTER, in printing, is disposing the forms on the press so that the lines and pages printed on one side of the sheet fall exactly on those of the other.

REGISTER, among letter-founders, is one of the inner parts of the mould in which the printing-types are cast. Its use is to direct the joining the mould justly together again, after opening it to take out the new-cast letter.

REGLETS, or **RIGLETS**, in printing, are thin slips of wood, exactly planed to the size of the body of the letter. The smaller sorts are placed between the lines of poetry; and both those and the larger are used in filling up short pages, in forming the whites or distances between the lines of titles, and in adjusting the distances of the pages in the chase so as to form register.

REGRATOR, or **REGRATER**, in law, formerly signified one who bought wholesale, or by the great, and sold again by retail; but the term is now used for one who buys any wares or victuals, and sells them

again in the same market or fair, or within five miles round it. See **FORESTALLING**.

Regrator, is also used for one who furnishes up old moveables to make them pass for new. And masons who take off the outward surface of hewn stone, in order to whiten it, or make it look fresh again, are said to *regrate*.

REGULATOR of a *Watch*, the small spring belonging to the balance: serving to adjust its motions, and make it go faster or slower.

REGULUS. The name regulus was given by chemists to metallic matters when separated from other substances by fusion. This name was introduced by alchemists, who, expecting always to find gold in the metal collected at the bottom of their crucibles after fusion, called this metal, thus collected, regulus, as containing gold, the king of metals. It was afterwards applied to the metal extracted from the ores of the semi-metals, which formerly bore the name that is now given to the semi-metals themselves. Thus we had regulus of antimony, regulus of arsenic, and regulus of cobalt.

RELEASE, is the relinquishment or discharge of any right of action, which a man hath, or may claim, against any other. Releases are of two kinds, viz. as to lands, goods, and chattels; and as to actions real, personal, or mixed. Every release must be of the same nature with the thing or obligation released; thus, if an agreement be in writing, the release also must be in writing.

If two persons are jointly and severally bound, a release to one of the parties will discharge the other.

The most effectual release that can be given, is a release of all demands, which will fully discharge all sorts of actions, rights, and titles, rents, covenants, annuities, contracts, recognizances, &c.

General Release.

Know all men by these presents, That I, A. B. of the Strand, in the county of Middlesex, grocer, have remised, released, and for ever quitted claim; and by these presents do, for me, my heirs, executors, and administrators, remise, release, and for ever quit claim unto C. D. of Bishopsgate-street, in the city of London, oilman, his heirs, executors, and administrators, and every of them, of and from all, and all manner of actions, cause and causes of actions, suits, bills, bonds, writings, debts, dues, accounts, sum and sums of money, judgments, executions, extents, quarrels, controversies, trespasses, damages, and demands whatsoever, both in law and equity, or otherwise howsoever, which against the said C. D. I ever had, now have, or which my heirs, executors, or administrators, shall or may hereafter have, claim, challenge, or demand, for or by reason, or by means of any matter, cause, or thing whatsoever, from the beginning of the world unto the day of the date

hereof: In witness whereof, I have hereunto set my hand and seal, this first day of September, in the year of our Lord one thousand eight hundred and nine.

A. B. (L. S.)

Sealed and delivered, being
first duly stamped, in the
presence of

E. F.

G. H.

Release from Creditors to a Debtor upon Compounding his Debts.

To all, &c. We, who have hereunto set our hands and seals, creditors of A. B. of, &c. send greeting: Whereas, the said A. B. oweth, and is indebted to us, his said creditors, in several sums of money, which he is not able fully to satisfy, we therefore have agreed, and do hereby agree, to accept the sum of £.—, of lawful money of Great Britain, in full satisfaction of all the debts owing to us respectively, at the sealing hereof, by and from the said A. B. which said sum of £.—, was this day paid to C. D. one of the creditors of the said A. B. for the use, and to the intent, that the same may be shared and divided amongst us, his said creditors, according to the debts to us severally due and owing: Now therefore know ye,

That for the consideration aforesaid, each of us, the said creditors, who have hereunto set our hands and seals, for him and herself, his and her heirs, executors, and administrators, doth, by these presents, remise, release, and for ever discharge the said A. B. his heirs, executors, and administrators, of and from all, and all manner of action and actions, &c. (as in the first release) which against the said A. B. each and every of us, his said creditors, now hath, or which each and every of our heirs, executors, or administrators, respectively hereafter, may, can, or ought to have, claim, or demand, for, upon, or by reason of any other matter, cause, or thing whatsoever, from the beginning of the world unto the day of the date hereof: In witness, &c.

REMIT. To remit a sum of money, bill, or the like, is to send the sum of money, &c. Remittances are frequently made through the medium of bankers, and the money paid them in these cases for their trouble, &c. is termed commission.

RENEWAL OF LEASES. To ascertain what fine should be given for the renewal of any number of years lapsed in a lease originally granted for twenty-one years, the following table will furnish the necessary means.

TABLE.

Years.	5 per cent.	4 per cent.	5 per cent.	6 per cent.	8 per cent.	11, 56 $\frac{1}{2}$. per cent
1	.538	.439	.359	.294	.199	.100
2	1.091	.895	.736	.606	.413	.212
3	1.661	1.370	1.132	.936	.645	.338
4	2.249	1.863	1.547	1.287	.895	.477
5	2.854	2.377	1.983	1.658	1.165	.633
6	3.477	2.911	2.441	2.052	1.457	.806
7	4.119	3.466	2.922	2.469	1.773	1.000
8	4.780	4.043	3.428	2.911	2.113	1.216
9	5.461	4.644	3.958	3.380	2.481	1.457
10	6.162	5.269	4.515	3.877	2.878	1.726
11	6.885	5.918	5.099	4.404	3.307	2.026
12	7.629	6.594	5.713	4.962	3.770	2.361
13	8.395	7.296	6.358	5.554	4.270	2.734
14	9.185	8.027	7.035	6.182	4.810	3.151
15	9.998	8.787	7.745	6.847	5.394	3.616
16	10.835	9.577	8.492	7.552	6.024	4.135
17	11.698	10.399	9.275	8.299	6.705	4.713
18	12.586	11.254	10.098	9.091	7.440	5.359
19	13.502	12.143	10.962	9.931	8.234	6.079
20	14.444	13.068	11.869	10.821	9.091	6.882
Total	15.415	14.029	12.821	11.764	10.017	7.779

Mode of working a question by the above Table.

What ought to be given as a fine for the renewal of fifteen years lapsed, or expired, in a lease for twenty-one years, allowing the tenant five per cent. interest, and estimating the clear and improved rent at sixty guineas per annum?

Against 15 in the table, and under 5 per

cent. is 7.745, and this multiplied by 63 $\frac{1}{2}$. gives 487.935=487 $\frac{1}{2}$ l. 18s. 8 $\frac{1}{2}$ d.

6.847 $\times$ 63=431 $\frac{1}{2}$ l. 7s. 2d.

Or, 5.594 $\times$ 63=352 $\frac{1}{2}$ l. 16s. 5d.

To ascertain the value of the fine which ought to be given for renewing a stated number of years in any lease, the rule is as follows:

The value for renewing an additional term, or for adding any number of years to the unexpired part of an old lease, is equal to the difference between the value of the lease for the whole term, and the value of the unexpired part.

Ex. What ought to be given for the addition of seven years to a lease, of which thirteen are unexpired; allowing six per cent. for money?

The whole term for which the new lease is to be granted is 20 years; therefore, by the table (inserted under LEASE, *which see*) we find that against 20 is 11.469, and
 against 15 is 8.852;

leaving 2.617 for the number of years purchase which ought to be given for the renewal.

RENT, is a compensation or return in the nature of an acknowledgment for the use and occupation of some corporeal inheritance; or it may be defined to be a certain profit issuing yearly out of lands and tenements corporeal.

It is essential to rent, that it should be a profit, and that that profit should be certain, that it should issue out of the thing granted, and not be part of the land or thing itself; it must also issue yearly, because the profits arise, and are renewed, yearly; though it is not necessary that it should issue every successive year, but it may be reserved every second, third, or fourth year.

There are three descriptions of rent, viz. Rent Service, so called, because the pecuniary rent is connected with personal service. Rent Charge, because the land is liable to the distress, not of common right, but by virtue of a clause in the deed charging the land with a distress for the payment of it. Rent-seck, or barren-rent, which is nothing more than a rent reserved by deed, but without any clause of distress.

There are also some other species of rents, as Quit-Rents, so called, because thereby the tenant goes quit and free of all other services. Rack-Rents, which are rents of the full, or nearly the full value of the tenements; and Fee-farm Rent, which is reserved upon a grant in fee, and so called from the perpetuity of the rent or service.

Where a lessee covenants to pay rent and repair, with express exception of casualties by fire, he will be liable upon the covenant for rent, though the premises are burned down, and not rebuilt by the lessor, after notice; and if he covenants generally to repair, he is bound to rebuild the premises, if burned down by an accidental fire; but a clause is generally inserted, that if premises are not rebuilt within a certain time after notice, such rent shall, from that time, cease and determine.

RENTERING, (Rent-mending,) in manufactures, is the same with fine-drawing. It consists in sewing two pieces of cloth, or

woven hose, edge to edge without doubling them, so that the seam scarcely appears; and hence it is denominated fine-drawing. It is a French word, meaning the same thing, and is derived from the Latin *retrahere*, or *re, in,* and *trahere*, to draw, because the seam is *drawn in* or covered. It is said, that in the East Indies, if a piece of fine muslin is torn, and afterwards mended by the fine-drawers, it will be impossible to discover where the rent was. In this country the dexterity of the fine-drawers is not so great, as that of those in the East; but it is still such as to enable them to defraud the revenue, by sewing a head or slip of English cloth on a piece of Dutch, Spanish, or other foreign cloth; or a slip of foreign cloth on a piece of English, so as to pass the whole as of a piece, and by that means avoid the duties, penalties, &c.

In Nottingham or Leicester it is sometimes done by way of experiment, to cut a stocking in two, the cross way of the leg, and give it to a fine-drawer, who mends it in such a manner, that the cut cannot be discovered.

RENTERING, in tapestry, is the working new warp into a piece of damaged tapestry, whether eaten by the rats, or otherwise destroyed, and on this warp to restore the ancient pattern or design. The warp is to be of woollen, not linen. Among the titles of the French tapestry-maker is included that of renterers.

REPEATER, a watch that strikes the hour by means of a spring connected with the shank or handle, which latter is moveable: the spring acts upon a bit of sonorous metal, and is put in motion by pressing the shank with the thumb till it appears to enter the body of the watch. The French were some years ago most celebrated for their dexterity in the formation of this kind of trinket; but of late this trade has been divided with England and other countries.

REPLEVIN, is the re-delivering to the owner, by the sheriff, his goods distrained upon any cause, upon surety that he will pursue the action against him who distrained; and if he pursue it not, or if it be adjudged against him, then he who took the distress may have it returned, or the value thereof, and all costs, charges, and expenses.

REPORTS, on a ship's arrival at the custom-house, are made in the following manner. After exactly copying the manifest (a transcript of which is given at the foot of this article) on two sheets of paper, you must go to the comptroller, or to the deputy comptroller in the long room, (accompanied by the master,) and read the two manifests over with him, of which he retains that written on the plain sheet, and the other with the printed oath you must return to the usher from whom you received it, who, after examining the master concerning the ship, and the latter swearing to the mani-

fest, directs you how, and to whom, you must pay for entering the ship. Your next business is to see whether those principally concerned in her cargo have made their entries, and if they have not, you may apply for their doing it, in order to set the ship to work, and begin her discharge. The person directed by the owners to take an account of every merchant's goods as they are delivered (called the ship's husband) having got the land-waiter's name appointed to the ship, applies to him for information of what merchants have made their entries, and for a copy of his warrant, which he signs, and

sends aboard the ship to the officers there, that they may commence their work, which they soon after do, and send a hoy or lighter to the quays. And against the lighter's arrival, the ship's husband has prepared a book, ruled in the same manner as the waiter's; on one side of which he places the number, and quantity, of goods he judges the lighter may contain, and opposite thereto he sets down the marks, and numbers, of each parcel as it is landed; and as soon as the lighter is delivered, he takes a view, or gets the surveyor to give him an account of the damage (if any) upon the goods.

Form of a Manifest of Goods shipped on board the George, Thomas Smith, Master, from St. Petersburg to London.

(A copy of which constitutes the Captain's REPORT at the Custom-house in England.)

123 bundles of rough hemp	-	} for Walkington and Co.
7 packs and 12 bobbins of flax	-	
8 hundred of ordinary deals	-	
17 ordinary deals	-	} for the ship's use.
100 mats	-	
3 pounds of tea	-	
2 dozen bottles of brandy	-	
London, 10th of August, 1809.		THOMAS SMITH.

Copy of a Manifest of Goods, on board the ship George, Thomas Smith, Master, bound to the Sound and St. Petersburg.

N. B. This constitutes the REPORT necessary to be made at the Foreign Custom-houses.

<i>For the Sound.</i>			
K. 11	-	1 bale for John Rose	- 6 rix dollars.
<i>For St. Petersburg.</i>

T. D.	-	1 box of cloth	
S. E.	-	1 bale E. Priestley	- 25
C. 50 to 57	-	7 barrels of rice, D. Hagen	- 15

600

REPRINT, among publishers, implies a new edition of a literary composition.

REPRISALS. Where the people of one nation have unlawfully seized, and detained, property belonging to the subjects of another state, the subjects of that state are authorised, in return, by the law of nations, to indemnify themselves, by seizing the property of the subjects of the state aggressing; this is termed making reprisals; and commissions are issued from the Admiralty, which are called letters of marque and reprisal, but which are often issued before hostilities are actually commenced. See LETTERS OF MARQUE.

REPRISE, or REPRIZE, at sea, is a merchant-ship, which, after its being taken by a corsair, privateer, or other enemy, is retaken by the opposite party.

If a vessel thus retaken has been 24 hours in the possession of the enemy, it is deemed a lawful prize; but if it is retaken within that time, it is to be restored to the proprietor, with every thing in it, upon his allowing one-third to the vessel which made the reprise. Also if the reprise has been abandoned by the enemy, either in a tempest or from any other cause, before it has been led into any port, it is to be restored to the proprietor. See PRIZE-SHIPS.

REQUEST NOTES, are certain written notes or requests from persons amenable to the excise laws, to obtain a permit for removing any exciseable articles from one place to another.

RESCOUNTER, a commercial term generally made use of in settling mercantile accounts in Holland, Germany, and other

northern countries on the continent of Europe. It proceeds upon the original first principle of commerce, barter, or exchange

1818.	J. Vanderberg, Rotterdam,			
Jan. 12.	Bought of James Wilson,			
	20 hogsheads of Lisbon	£.	£.	
	wine at - - -	15	-	300
May 5.	30 boxes of oranges at - -	5	-	150
				£.450
Sept. 10.	Adjusted or settled this account per			
	Rescounter.			

J. VANDERBERG.

But, if the unequal value of the commodities, or the amount between the articles bought and sold, leaves a balance unaccounted for by barter, such balance is stated to have been paid thus: *solvit per banco, solvit per cassa, solvit per wessel*, &c. denoting payments by assignment on the bank, in cash, or by bills of exchange, &c.

RESCOUNTERS. This word was adopted from the Dutch by the stock-brokers of London, in their transactions with each other in buying into, and selling out of the public funds, constituting the national debt, when bought, or sold, for a future time, subsequent to the date of the transaction. Nothing could be more just or equitable than the original design of these contracts, nor any thing more infamous than the abuse that has been made of it.

The original intention was, that a Dutchman, or any other foreigner, having occasion to buy into, or sell out of, our public funds, being informed by his correspondent at London, of an advantageous opportunity of doing either, might be enabled to embrace such an opportunity, by writing (let us suppose from Amsterdam) to a friend in London, to contract immediately for any quantity of stock against a limited future time; if to buy, when the price has fallen; if to sell, when it has risen three, four, or five per cent. on the days of making the agreement; in the expectation that before the expiration of the time granted, the foreigner would remit the sum required for the transfer, in the case of purchasing, or being a holder of the stock sold; a power of attorney to sell it; and in both cases, to secure a profit on the rise or fall. Whereas, without these credits for time, the opportunity of taking advantage of the temporary variations in the prices would be lost, for want of remittances, or the inability, or unwillingness of the London agent to advance the money on the day of making the contract; for, in the common course of dealings in the funds, the money to be paid or received must be ready at the same time as the transfer is made at the bank of England, or other public offices.

The four principal times for which bargains are usually made, are, February, May, August, and November; and on or about

of commodities, without the intervention of money. It is best explained by example:

1818.				
Feb. 9.	Sold to J. Wilson,			
	30 pieces of Hol-	£.	£.	
	land linen, at 10 -			300
	25 barrels of pickled			
	herrings at - 6 -			150
				£.450

the last day of each month, such accounts are settled by the brokers with each other, and those settlements are called rescouters.

The abuse of these time-bargains constitutes stock-jobbing; for accounts to immense sums are raised and settled without any transfer being made, or any stock really bought or sold.

RESIDUARY PROPERTY, is that which remains in the hands of executors, after discharging the particular bequests of the testator. This residue is disposed of according to the direction of the testator.

RESIN, (GER. *Harz*, *Harpise*. DU. *Hars*, *Harst*, *Harpuis*. DA. *Harpir*. SW. *Käda*, *Harpös*. FR. *Resine*. IT. *Resina*, *Rasia*. SP. and PORT. *Resina*. RUS. *Smola*, *Harpius*. POL. *Zywica*. LAT. *Resina*.) in a general sense, implies a viscid juice, oozing either spontaneously, or by incision, from several vegetable productions, as the pine, the fir, and various kinds of trees and plants; and hence not only the common rosin, but mastich, sandarach, elemi, tacamahac, animé, labdanum, balm of Gilead, capivi, dragon's blood, guaiacum, and copal, come under this appellation. It is not our design to treat of each of these species of resin under the present article: having already noticed them under the head GUM; by which term they are commonly designated.

This substance is obtained from different species of fir; as the *pinus abies*, *sylvestris*, *larix*, *balsamea*. It is well known, that a resinous juice exudes from the *pinus sylvestris*, or common Scotch fir, which hardens into tears. The same exudation appears in the *pinus abies*, or spruce fir. These tears constitute the substance called *thus*, or common frankincense. When a portion of bark is stripped off these trees, a liquid juice flows out, which gradually hardens. This juice has obtained different names, according to the plant from which it comes. The *pinus sylvestris* yields common turpentine; the *larix*, Venice turpentine; the *balsamea*, balsam of Canada, &c. All these juices, which are commonly distinguished by the name of turpentine, are composed of two ingredients; namely, oil of turpentine, and rosin. When the turpentine is distilled, the oil comes over, and the rosin remains behind. When the distillation is continued to dryness, the

residuum is known by the name of common rosin, or *colophonium*; but when water is mixed with it while yet fluid, and incorporated by violent agitation, the mass is called yellow rosin. During winter, the wounds made in the fir-trees become incrustated with a white brittle substance, called *barras* or *gallipot*, consisting of rosin united to a small portion of oil. The yellow rosin, made by melting and agitating this substance in water, is preferred for most purposes; because it is more ductile, owing, probably, to its still containing some oil.

Considerable quantities of common rosin are consumed by salt-boilers, in combination with wheaten flour, to render the grain of salt smaller; and likewise by musical instrument-makers and musicians, for effecting greater vibrations by the bows of violins. It has further been conjectured, that rosin might be so prepared, as to adapt it to the purpose of making candles: and it is also believed, that it is employed in great quantities in the making of glue.

RESPONDENTIA. When money is lent upon the goods and merchandise laden on a ship, which, from their nature, must be sold, or exchanged, in the course of the voyage, then the borrower only is personally bound to answer the contract; who, therefore, in this case, is said to take up money at *respondentia*. In this consists the difference between *respondentia*, and *bottomry*; that the former is a loan upon the goods, the other upon the ship and tackle: in the former, for the most part, recourse must be had to the person of the borrower; in the latter, the ship and tackle are liable, as well as the person of the borrower. See **BOTTOMRY**.

Upon *respondentia*, the lender must be paid his principal and interest, though the ship perish, provided the goods are safe. In all other respects the contract of *bottomry*, and *respondentia* are upon the same footing.

The lender at *respondentia* runs almost the same risks, with respect to the property, on which the loan is made, as the insurer does with respect to the effects insured. There are, however, some considerable distinctions; for instance, the lender supplies the borrower with money to purchase those effects upon which he is to run the risk: not so with the insurer. There are also various other distinctions.

The amount of loan at *respondentia*, in this country, is not restrained by any regulation whatever; although it is in many maritime states by express ordinances: the only restriction in the laws of England is with respect to money lent on goods going to the East Indies, which, by stat. 19 Geo. 2. c. 37. s. 50. must not exceed the value of the property on which the loan is made.

Lender is answerable for losses by capture.

But if a ship be taken and detained for a short time, and yet arrive at destined port within time limited, bond is not forfeited.

Lender is neither entitled to the benefit of salvage, nor liable to contribute in case of a general average.

But the stat. Geo. 2. c. 37. allows the benefit of salvage to lenders upon going to the East Indies.

In an action on a policy of insurance upon a *respondentia* bond, at and from B. to C. *Walpole v. Ewer. Sitt. aft. Trin. 1789.* The ship was Danish, and an average loss was sustained upon the goods to the amount of 6*l.* 15*s.* per cent. and the plaintiff, as holder of a *respondentia* bond, had been called upon to contribute; and now brought his action against the English underwriters, for the amount of that contribution; held that the plaintiff was entitled to recover, because by the law of Denmark, lenders upon *respondentia* are liable to average, and bound to contribute according to the amount of their interest;—the insurer must answer to them.

The obligee in any *respondentia* bond, made and entered into upon good and valuable consideration *bonâ fide*, shall be admitted to claim, and after the contingency shall have happened, to prove his or her debt or demands in respect of such bonds, in like manner as if the contingency had happened before the time of issuing the commission of bankruptcy against the obligor, and shall be entitled to receive a dividend of such bankrupt's estate in the same proportion to the other creditors.

FORM OF A RESPONDENTIA BOND.

Know, all men, by these presents, that
held and firmly bound to
in the sum or penalty of _____ of good
and lawful money of Great Britain, to be
paid to the said _____ or to
certain attorney, executors, administrators,
or assigns, to which payment well and truly
to be _____ heirs, executors, and administrators, firmly, by these presents, sealed,
with _____ seal, Dated this
_____ day of _____ in the _____ year of
the reign of our sovereign lord _____ by
the grace of God, of the United Kingdom of
Great Britain and Ireland, king, defender of
the faith, and in the year of our Lord one
thousand eight hundred and _____ The
condition of the above-written obligation
is such, that whereas the above-named
_____ hath, on the day of the date above-
written, lent unto the above-bound
_____ the sum of _____ upon the merchan-
dise and effects to that value laden, or to be
laden, on board the good ship or vessel,
called the _____ of the burthen of
_____ tons, or thereabout, now in the river Thames,
whereof _____ is commander: if the
said vessel do, or shall, with all convenient
speed, proceed and sail from and out of the
said river of Thames, on a voyage to any
ports or places in the East Indies, China,
Persia, or elsewhere, beyond the Cape of

Good Hope, and thence do and shall sail and return into the said river of Thames, at or before the end and expiration of thirty-six calendar months, to be accounted from the day of the date above-written, and that without deviation, (the dangers and casualties of the seas excepted). And if the above bound heirs, executors, or administrators, do and shall, within days next, after the said ship or vessel shall be arrived in the said river of Thames, from the said voyage, or at the end and expiration of the said thirty-six calendar months, to be accounted as aforesaid, (which of the said time shall first and next happen,) well and truly pay, or cause to be paid, unto the above-named executors, administrators, and assigns, the sum of of lawful money of Great Britain, together with of like money, by the calendar month, and so proportionally for a greater or lesser time than a calendar month, for all such time, and so many calendar months as shall be elapsed, and run out of the said 36 calendar months, over and above 20 calendar months, to be accounted for from day of the date above-written; or, if in the said voyage, and within the said thirty-six calendar months, to be accounted as aforesaid, an utter loss of the said ship or vessel by fire, enemies, men of war, or any other casualties should unavoidably happen; and the above-bound heirs, executors, and administrators, do and shall, within six months next after the loss, pay and satisfy to the said executors, administrators, or assigns, a just and proportional average on all goods and effects, which the said carried from England, on board the said ship or vessel, and on all other the goods and effects of the said which shall acquire during the said voyage, and which shall not be unavoidably lost: then the above-written obligation is to be void, and of no effect, or else to stand in full force and virtue.

Scaled and delivered (being
first duly stamped), in the
presence of }

RESTITUTION is the yielding up or restoring any thing unlawfully taken from another.

The owner of goods stolen, who has prosecuted the thief to conviction, cannot recover the value of such goods from a person who has purchased, and sold them again, even with notice of the theft before conviction; but the plaintiff has a right to the restitution of the goods in specie; yet if it shall appear to the court, that the party has been guilty of a gross neglect in prosecuting, he will not be entitled to restitution.

If the owner takes his goods back again of the offender, in order to favour or maintain him, this will be unlawful and punish-

able by fine and imprisonment; but after the felon is actually convicted, the owner may take his goods again wherever he finds them.

RETAIL is a dealing in small quantities, in opposition to dealing by wholesale. Dealing, by retail, is what principally distinguishes the tradesman from the merchant, who imports and exports goods, and sells them by wholesale.

RETAINER OF DEBTS, is the power which a person has of giving himself a preference in payment of debts, for which he has the assets in his own hands; as an executor, among debts of equal degree, may pay himself first, by retaining in his own hands the amount of his debt, which he may do, although such retainer should swallow up the whole of the testator's personal property, and leave nothing for the rest of the creditors.

RETURN OF PREMIUM, *in the law of insurance*. In all countries in which insurances have been known, it has been a custom coëval with the contract itself, that where property has been insured to a larger amount than the real value, the insurer shall return the overplus premium. *Loccenius de Jure Marit.* 2. c. 5. s. 8.

If the ship arrive before the policy is made, and the underwriter is acquainted with the arrival, but the insured is not, the premium is to be restored.

If both parties be ignorant of the arrival of the ship, the underwriter to retain.

The parties frequently insert clauses in the policy, stating, that upon the happening of a certain event, there shall be a return of premium; and these clauses are binding. *Dougl.* 268.

If goods are insured to come in certain ships from abroad, and not shipped, premium is to be returned. *1 Mag.* 90.

If the ship or property insured was never brought within the terms of the written contract, so that the insurer has never run any risk, the premium must be returned. *1 Vesey*, 319.—*Penson v. Lee*, 2 B. & P. 330.

Where a clause was inserted in policy that 8 per cent. of the premium should be returned if the ship sailed from the West India islands, with convoy for the voyage, and arrives, the court held, that the arrival of the ship, with, or without, convoy, entitled the party to a return of premium. *Symond and another, v. Boydell.* *Dougl.* 225.—*Aguilar v. Rogers*, 7 T. R. 421.

It is held, that whether the cause of the risk not being run is attributable to the fault, will, or pleasure, of the insured, the premium is to be returned. *Cowp.* 668.

But if the risk has once commenced, there shall be no appointment or return of premium afterwards. Therefore no return in deviations. *Hogg. v. Horner.* *Sittings after Mich.* 1797.—*Tait v. Levi*, 14 E. R. 481.

Where a policy is void, as a wager policy, premium cannot be recovered. *Lowry and another, v. Bourdieu.* *Dougl.* 458.

Nor in the case of re-assurance, void by stat. 19 Geo. 2. c. 37.

Nor where the policy is made to cover a trading with the enemy. *Vanduyck v. Hewitt*. 1 East. 96. — *Potts v. Bell*, 8 T. R. 548. — *Shiffner v. Gordon*, 12 E. R. 296.

If there are two voyages in contemplation of the parties, or by the usage of trade, and only one made, the premium shall be returned on the other. *Stevenson v. Snow*, 3 Burr. 1257. 1 Blac. 318. S. C. — *Rotthwell v. Cook*, 1 B. & P. 172.

Where the contract is entire, whether for a specified time or a voyage, there shall be no apportionment or return, if the risk has once commenced. Where the premium is entire in a policy on the voyage, when there is no contingency, at any period, out, or home, upon the happening of which the risk is to end, nor any usage established upon such voyage; though there be several distinct ports at which the ship is to stop, yet the voyage is one, and no part of the premium shall be returned. *Bermen v. Woodbridge*, Dougl. 781. — *Dalgleish v. Brook*, 15 E. R. 295.

If the insured have a contingent insurable interest in the thing insured, at the time when the policy is effected, and the risk once begun, there shall be no return, though it should eventually turn out that he had no title to the thing insured. *Boehm and others v. Bell*. 8 T. R. 154. See INSURANCE.

RETURNS, among merchants, a term expressive of the value, whether it consist of goods, or specie, returned by a consignee to the consigner of the whole, or part, of a cargo. Thus the returns sent us from the West Indies, in exchange for articles of British manufacture, &c. consist of sugar, coffee, cotton, &c.

RETORTS, (GER. *Retorten*. DU. *Krombalsen*. DA. and SW. *Retorter*, *Krumhals*. FR. *Retortes*, *Cornues*. IT. *Storte*. SP. *Retortas*. PORT. *Retortas*, *Cornutas*. LAT. *Retorta vasa*.) among chemists, are vessels employed for many distillations, and most frequently for those which require a degree of heat superior to that of boiling water. This vessel is a kind of bottle with a long neck, so bent, that it makes, with the belly of the retort, an angle of about sixty degrees. From this form they have probably been named retorts. The most capacious part of the retort is called its belly; its upper part is called the arch or roof of the retort, and the bent part is the neck.

Retorts differ in form and materials: their bellies are generally round: some of them are oblong, and shaped like a cucurbit: these are called English retorts. They are preferable for the distillation of matters which are subject to swell, and to pass into the receiver before they are decomposed.

A retort which has a little hole pierced in its roof is called a tubulated retort. This hole must be capable of being exactly closed

with a stopper of proper materials. Retorts of this kind are employed in distillations, where some matter must be introduced into the retort after the receiver is joined to it.

If the retort be well made, the above-mentioned inclination of its neck must be most favourable to distillation. When the neck is too much inclined, the receiver cannot be conveniently luted to it, and is also by this form brought too near the furnace. If the neck be too little inclined, the vapours or liquors, which rise in distillation, can scarcely flow into the receiver, from want of sufficient descent, and only circulate in the belly of the retort. Retorts, when too narrow in their bending, are very faulty. This form must be an impediment to distillation: the passage therefore from the belly to the neck of the retort must be free and wide, and gradually diminishing to the extremity of the neck or the mouth of the retort.

Retorts of different materials are used in chemical operations; viz. common glass, crystal-glass, stone-ware, and iron. Retorts of glass are used for all operations which require a less heat than is sufficient for their fusion. Earthen retorts are necessary where great heat is requisite, as in the preparation of phosphorus. Iron retorts are not much used, as they can only serve for the distillation of substances which cannot act upon this metal; and as these substances are few in number, they can seldom be employed but for the distillation of mercury, and of animal matters.

REVENUE, from the French word *revenu*, signifies merely return, and is used to designate the produce arising from any possessions. Thus the public revenue of a kingdom is the produce of its imposts, in the shapes of rents, taxes, duties, &c. &c. After what has been already exhibited, under various titles, especially Customs, Excise, Exports, Funds, National Debt, and Post Office, comprising the principal items contributing to the aggregate national revenue of Great Britain, it would be entering upon too voluminous a detail, if we were either to mark distinctly the gradual augmentation of, or the occasional fluctuation incident to, the national revenue of this country from early times. A much more profitable application of our pages, if it were practicable, would be an investigation of the comparative revenue, and expenditure, of all the different kingdoms of the world at the present juncture; because by that we might be better able to estimate the strength of our own; which, it is to be apprehended, we have been in the habit of viewing through too favourable a medium. If the position, generally admitted, be true, that wealth is power, and that the only national wealth which can be available for the purposes of power, is the surplus of annual revenue over the annual expenditure, the comparison of

the two, at the present moment, presents an awful subject for contemplation.

Comparative Taxation of Great Britain and France.

Great Britain and Ireland.

Computed for 1823, after deducting the taxes on salt, leather, and malt, lately reduced.

Gross amount, including expence of collection.

Assessed taxes	-	£6,500,000
Customs	-	11,000,000
Excise	-	27,000,000
Stamps	-	6,800,000
Land-tax	-	1,200,000
Post-office (nett amount)	-	1,400,000
Crown lands	-	200,000
All other government receipts	-	1,900,000
		56,000,000
Tithe	-	4,000,000
Poor-rate	-	5,000,000
		Total £65,000,000

France.

Gross amount, including expence of collection.

	Sterling.
<i>Foncier</i> , or land and house-tax	£9,000,000
<i>Mobilier</i> , a farther house-tax; the window-tax, and <i>patentes</i> or tax on professions	- 3,000,000
Customs	- 2,300,000
Excise; viz. duties on salt, tobacco, snuff, wine, &c., comprised under the name of <i>droits réunis</i>	- 9,000,000
Stamps; viz. <i>enregistrement</i> , <i>domaine et timbre</i>	- 6,000,000
Post-office (nett receipt)	- 600,000
Sale of wood from public forests	800,000
All other receipts, &c. including a large municipal revenue collected from <i>octrois</i> , &c.	6,300,000
	£37,000,000

Equal, adding 20 per cent. for greater value of money, to £45,000,000

See further titles CUSTOMS, FUNDS, NATIONAL DEBT, and SINKING FUND.

REVERSION, in law, is defined to be returning of lands, &c. into the possession of the donor, or his heirs. Reversion, in the law of England, has two significations; the one of which is an estate left, which continues during a particular estate in being; and the other is the returning of the land, &c. after the particular estate is ended; and it is further said to be an interest in lands, when the possession of it fails; or where the estate, which was for a time parted with, returns to the grantors, or their heirs. But, according to the usual definition of a reversion, it is the residue of an estate left in the grantor, after a particular estate granted away ceases.

The difference between a remainder, and a
850

reversion, consists in this: that the remainder may belong to any man except the grantor; whereas the reversion returns to him who conveyed the lands, &c.

In order to render the doctrine of reversion easy, see the following table; which shows the present value of one pound, to be received at the end of any number of years not exceeding forty; discounting at the rate of five, four, and three per cent. compound interest. See INTEREST.

Years.	Value at 5 per cent.	Value at 4 per cent.	Value at 3 per cent.
1	.9524	.9615	.9709
2	.9070	.9245	.9426
3	.8638	.8898	.9151

39	.1491	.2166	.3158
40	.1420	.2083	.3066

The use of the preceding table. — To find the present value of any sum to be received

at the end of a given term of years, discounting at the rate of three, four, or five per cent. compound interest. Find by the above table the present value of one pound, to be received at the end of the given term, which multiply by the number of pounds proposed (cutting off four figures from the product on account of the decimals), then the result will be the value sought. For example: the present value of 10,000*l.* to be received ten years hence, and the rate of interest five per cent. is equal to $.6139 \times 10,000 = 6139.0000$, or 6139*l.* Again, the present value of 10,000*l.* due in ten years, the rate of interest being three per cent. is $.7441 \times 10,000 = 7441*l.*$

REVISE, in printing, a second proof of a corrected sheet.

REYDER, a gold coin, current in Holland at 1*l.* 4*s.* 6*d.* There is also a gold coin, current in the same kingdom, called the half reyder; its value is conformable to its denomination (12*s.* 5*d.*).

RHAPONTIC, (GER. *Rhapontik*. DU. DA. and SW. *Rapontik*. FR. *Rapontic du Levant*. IT. and SP. *Rapontico*. PORT. *Ruiponto*. RUS. *Répontik*. POL. *Rapontyk*, *Rum moskiewski*. LAT. *Rhaponticum*.) a medicinal root resembling rhubarb. It was called *rha-ponticum*, or root of Pontus, because chiefly produced in Pontus, in Asia. This root may be distinguished from rhubarb by leaving a mucous taste in the mouth, and by its appearing, when cut, as if regularly marbled, of a red, white, or yellow colour; these colours being disposed in a radiated manner. It is less purgative than rhubarb, requiring a double quantity to produce the same effect. It is a little astringent.

Rhapontic is common enough in the gardens of botanists, and flowers in May. It is principally cultivated in Asiatic Russia, and Persia, whence it is sent to Europe through the ports of Smyrna and Aleppo. The rhapontic thus imported is of a dusky colour on the surface, and of a loose spongy texture. The foot-stalks of the leaves, and their large rib-stalks, peeled, being of an acid taste, make very good tarts.

RHINEHURST, white resin coming to us by way of Holland, and deriving its name from the Dutch *Rhynse harst*.

RHODIUM or ROSE-WOOD, a wood or root brought from the Canary islands, and confounded with aspalathus, a simple of considerable esteem among the ancients, but which has not come to the knowledge of latter times.

The writers on botany and the materia medica are much divided about the *lignum rhodium*, not only with regard to the plant which affords it, but likewise in their accounts of the drug itself. This confusion seems to have arisen from an opinion, that the rhodium and *aspalathus* are the same.

As to *aspalathus*, the ancients themselves disagree; Dioscorides requiring by this appellation the wood of a certain shrub freed from the bark, and Galen the bark of a root.

At present we have nothing under this name in the shops.

The *lignum rhodium* of the shops, is usually in long crooked pieces, full of knots, which, when cut, appear of a yellow colour like box, with a reddish cast: the largest, smoothest, most compact, and deepest-coloured pieces should be chosen; and the small, thin, or pale, ones rejected. The taste of this wood is lightly bitterish, and somewhat pungent; its smell very fragrant, resembling that of roses; when long kept, it seems to lose its smell; but on cutting or rubbing one piece against the other, it smells as well as at first. Distilled with water, it yields an odoriferous essential oil, in very small quantity. Rhodium is at present in esteem only upon account of its oil, which is employed as a high and agreeable perfume in scenting pomatums and the like. It is likewise said to be much employed by rat-catchers, either to entice the rats to the traps, or to cover the smell left by handling them. But if we may reason from analogy, this odoriferous simple might be advantageously applied to nobler purposes; a tincture of it in alcohol, which contains in small volume the virtue of a considerable quantity of the wood, bids fair to prove a serviceable-cordial, not inferior perhaps to any thing of this kind.

Jamaica affords a wood which the natives call rose-wood; and which, though not the genuine rhodium, has much of its smell.

For the foreign names of Rhodium, see ROSE-WOOD.

RHODIUM, a metal discovered by Dr. Wollaston, in the year 1804, in the ores of platina. He called it rhodium, from its salts generally forming rose-coloured solutions. Rhodium is a white metal, with a tint of yellow; it is as hard, and more brittle than iron; and very infusible. Its specific gravity is 10.649. It forms alloys with all the metals except mercury. Rhodium is capable of three states of oxidation, which are in colour black, light-brown, and dark-red.

RHUBARB. (GER. and DU. *Rhabarber*. DA. and SW. *Rabarber*. FR. *Rhubarbe*, *Rubarbe*. IT. *Rabarbaro*, *Reobarbaro*. SP. and PORT. *Rubarbaro*. RUS. *Rewen*. POL. *Reubarbarum*, *Rumturekie*. LAT. *Rhabarbarum*, *Reumpalmatum*.) Of the *Rheum* or rhubarb-plant there are seven species, of which the following are the most noted: 1. the rhapontic, already described under its proper article; 2. the true Chinese rhubarb, with palmated leaves, a thick fleshy root, yellow within, and accounted to be the true foreign rhubarb, the purgative quality whereof is well known; 3. the Tartarian rhubarb, with a large, fleshy, branched root, yellow within, crowned by very large, heart-shaped, somewhat lobated, sharply indented, smooth leaves, an upright large stem, and supposed to be the true rhubarb, but, though of superior quality to some sorts, is inferior to

the true Chinese; 4. the undulated, or waved-leaved Chinese rhubarb, with a thick, branchy, deep-striking root, yellow within, crowned with large, oblong, undulate, somewhat hairy leaves, having equal foot-stalks, and an upright firm stem, terminated by long loose spikes of white flowers; 5. the currant rhubarb of Mount Libanus, with a thick, fleshy root, very broad leaves, full of granulated protuberances, with equal foot-stalks, upright firm stems, terminated by spikes of flowers, succeeded by berry-like seeds, surrounded by a purple pulp.

All these plants are perennial in root, and the leaves and stalks are annual. The roots being thick, fleshy, generally divided, strike deep into the ground; of a brownish colour without, and yellow within; the leaves rise in the spring, generally come up in a large head folded together, gradually expanding themselves, having thick foot-stalks; and grow from one to two feet high, or more, in length and breadth, spreading all round: amidst them rise the flower-stems, attaining their full height in June, when they flower, and are succeeded by large triangular seeds, ripening in August.

They are generally propagated by seeds sown in autumn soon after they are ripe, or early in the spring, in any open bed of light deep earth. They increase in size annually, and in the second or third year many of them will shoot up stalks, flower, and perfect seeds; and in three or four years the roots will be arrived to a large size, though older roots are generally preferable for medical use.

Two sorts of rhubarb are met with in the shops. The first is imported from Turkey and Russia, in roundish pieces freed from the bark, with a hole through the middle of each: they are externally of a yellowish colour, and on cutting appear variegated with lively reddish streaks. The other, which is less esteemed, comes immediately from the East Indies, in longish pieces, harder, heavier, and more compact than the foregoing. The first sort, unless kept very dry, is apt to grow mouldy and worm-eaten; the second is less subject to these inconveniences. Some of the more industrious artists are said to fill up the worm-holes with certain mixtures, and to colour the outside of the damaged pieces with powder of the finer sorts of rhubarb, and sometimes with cheaper materials: this is often so nicely done, as effectually to impose upon the buyer, unless he very carefully examines each piece. The marks of good rhubarb are, that it is firm and solid, but not flinty; that it is easily pulverised, and appears, when powdered, of a fine bright yellow colour; that, upon being chewed, it imparts to the spittle a saffron tinge, without proving slimy or mucilaginous in the mouth. Its taste is sub-acrid, bitterish, and somewhat astringent; with a smell lightly aromatic.

The mountains of Thibet abound with rhubarb; and it is produced in great plenty

on the confines of China and Tartary, and in many parts of Tartary itself.

The Turkey rhubarb is, among us, universally preferred to the East India sort, though this last is, for some purposes at least, equal to the other; it is manifestly more astringent, but has somewhat less of an aromatic flavour. Tinctures drawn from both with rectified spirit have nearly the same taste: on distilling off the menstruum, the extract left from the tincture of the East India rhubarb proved considerably the strongest.

Rhubarb is a mild cathartic, which operates without violence or irritation. Besides its purgative quality, it is celebrated for an astringent one. Rhubarb in substance operates more powerfully as a cathartic than any of the preparations of it.

The yellow colour of the rhubarb is remarkably less destructible than any other vegetable yellows. Aquafortis and other acids, which destroy the colour of saffron, turmeric &c., make no change in that of rhubarb, or, at most, render it only turbid.

The method of curing the true rhubarb is as follows: Take the roots up when the stalks are withering or dying away, clean them from the earth with a dry brush, cut them in small pieces of about four or five inches in breadth, and about two in depth, taking away all the bark, and make a hole in the middle, and string them on pack-thread, keeping every piece apart; and every morning, if the weather is fine, place them in the open part of the garden on stages erected by placing small posts, about six feet high, in the ground, and six feet asunder, into which fix horizontal pegs, about a foot apart, beginning at the top; and the rhubarb being strung crosswise on small poles, place them on these pegs; so that if it should rain, you could easily remove each pole with the suspended pieces into any covered place. Never suffer them to be out at night, as the damps would be apt to mould them.

RHUMB, in navigation, a vertical circle of any given place, or the intersection of such a circle with the horizon; in which last sense rhumb is the same with a point of the compass.

RHUMB-LINE is also used for the line which a ship describes when sailing in the same collateral point of the compass, or oblique to the meridians.

RIAL, or **REAL**, a silver coin of Spain, current at Barcelona, Saragossa, and Valencia for $6\frac{2}{3}d$. and at Madrid, Cadiz, and Seville for $5\frac{1}{3}d$. sterling. This is called the *rial of plate*. The *rial of vellon*, or rial of exchange, is an imaginary money of account, equivalent to $\frac{1}{16}$ of a penny sterling. There are others of different values in different places of the same kingdom. See **MONIES**, *App.*

RIBS, of a Ship, those pieces of timber which strengthen the sides.

RIBBAND, or **RIBBON**, (*GER.* *Band*, *Seirdenband*. *Du. Lint.* *Da. Baand.* *Silkebaand.* *Sw. Band*, *Sidenband.* *FR.* *Ruban*.)

de soie. It. *Nastro di seta.* Sp. *Cinta de seda.* Port. *Fita de seda.* Rus. *Lenta*.) a narrow sort of silk band, chiefly used for ornaments of dress, badges of chivalry, &c. Ribbon-weaving is a light, easy, trade. The silk for the warp, or long way of the ribbon, which is generally of the finest kind, is wound round a machine, called a warping frame, and then taken off on a wheel, which is fixed at the end of the loom, and kept at a proper breadth by what is called a *sley*, which is not very unlike a fine comb, the silk threads going out between the teeth. The weaver next winds a coarser kind of silk on little quills, which are put into the shuttle. Then some of the threads that are round the sley are, by means of a treadle, which consists of long pieces of wood fixed to the tackle of the loom, pulled lower than the rest, and the shuttle put through the vacancy. The weaver then, putting his foot on the other treadle, pulls down those treadles that were before uppermost, and returns the shuttle back with his other hand; and this is repeated with astonishing celerity. In this manner all the plain weaving is performed; the only difference being in the strength, and breadth, of the looms, and the labour required to throw the shuttle. The ribbon-weaver's shuttle is different from that of most other weavers, though it serves for the same purpose. It is made of box, and is six, or seven, inches long, shod with iron at both ends, which terminate in points that are crooked, one towards the right, the other the left. The chief seats of the ribbon manufacture are Spitalfields, and Coventry. The importation of them from abroad is prohibited by divers statutes; and there is a bounty on their exportation.

RICE, (GER. *Reis*, *Reiss*. DU. *Ryst*. DA. *Ris*. SW. *Ris*. FR. *Ris*, *Riz*, *Ryz*. IT. *Riso*. SP. *Arroz*. PORT. *Arroz*, *Arros*. RUS. *Pscheno saruzinskoe*. POL. *Ryz*. LAT. *Oryza*, *Rizum*.) is a plant very much resembling wheat in shape, and colour, and in the figure and disposition of its leaves. The panicle which terminates the stem is composed of small flowers, distinct from each other, which have four unequal scales, six stamina, and one pistil, surrounded with two styles; this pistil becomes a white seed, extremely farinaceous, covered with two interior scales.

The cultivation of rice is most vigorous throughout Asia; and indeed this species of grain is the ordinary food of the inhabitants of China, India, Persia, Egypt, and almost the whole of the late territories of the Grand Signior. Rice is of two kinds, namely, the ordinary rice, and the fine rice. The first is that with which we are best acquainted, and it is usually grown in low marshy grounds. It is even customary in less swampy places, provided a river or stream be convenient, to inundate the rice by means of sluices, and completely to soak the herb so soon as it ap-

pears above the surface, as well as in its further progress towards maturity. The fibrous root of the rice plant puts forth stems, which generally grow to the height of four or five feet; these stems are chamfered thicker and firmer than those of wheat, and knotted with joints situated at equal distances: the leaves are long, fleshy, and somewhat similar to those of the leek; the flowers appear on the tops of the stalks or stems, are of a purple colour, and grow in clusters like the flowers of millet: to these succeed the seeds, which are of an oblong form, white, semi-transparent, and hard, and whereof each is inclosed in a yellowish, rough, chamfered, angulous, shaggy shell or rind, terminated by a point or spike, the whole being disposed alternately along the stems.

This is the species of rice that is generally brought from the Levant, and of which no inconsiderable quantities are grown in Piedmont in France. The latter is not so heavy or farinaceous as the other, and is, therefore, not so highly valued by commercial men.

There is another species of rice, called the dry rice, by reason of its being cultivated in India *without the aid of water*. It is grown on dry lands, principally on the mountains, and possesses a saccharine flavour not unlike that of the filbert. The best sort of this rice is produced at Mangalore, upon the coast of Malabar, on those mountains where the temperature of the atmosphere is from four to five degrees below that of the plains, where oranges and lemons are grown. The same kind of rice grows in Cochin China, where frost is entirely unknown, although the heat, during the summer, is not greater than in the southern provinces of France. It is invariably cultivated on the highest mountains, for it will not succeed in the plains. The mountaineers of Cochin China sow their rice in dry ground, as we sow our corn; and always perform this operation at the end of the rainy season, which answers to our February. It might perhaps be sown in Malta about the same time.

The fine rice of Mangalore is very differently treated. The seed is generally planted like pease.

If the plantation be situated in low ground, which receives the rain and absorbs the whole of it, the seed must be planted two feet asunder, with about four grains to every hole; but if the situation be a sloping one, or remarkably dry, the seed need only be eight or ten inches asunder, and planted about the depth of three inches from the surface, in furrows; the land may be afterwards strewn over with what seed remains. The fine rice usually appears above ground at the end of five or six days, provided the soil be fresh, but it remains much longer when the situation is dry; it ripens in about four or five months. One hundred pounds of rice in the husk, usually yield from 75 to 80 pounds of white rice. In India they cut the rice

very close to the ground; and, from the roots, exceedingly delicate blades soon spring up, which are esteemed good fodder for cattle.

Egypt first attended to the cultivation of rice, the pernicious effects of which rendered that country unhealthy. China, and the East Indies, must experience the same calamity, if art did not oppose preservatives to nature, whose benefits are sometimes accompanied with evils; or if the heat of the torrid zone did not quickly dispel the malignant vapours which are exhaled from the rice-grounds. It is a known fact, that in the rice-grounds of the Milanese, the cultivators are all livid and dropsical. The culture of rice is still very considerable about Damietta, Mansura, and other parts of Egypt. The port of Damietta alone is open for the exportation of rice.

Opinions differ about the manner in which rice has been naturalized in Carolina, in North America. But however the province may have acquired it, it is certain that the soil is favourable to it. This production grows, by the care of the negroes, in the morasses which are near the coasts. There is a wild kind of rice, growing in great plenty throughout the interior parts of North America, which supplies the inhabitants with food, without any further trouble than that of gathering it. It grows in the water, where it is about two feet deep, and where it finds a rich muddy soil. The stalks and the ears resemble those of cats, both in appearance and the manner of growing. The stalks are full of joints, and rise about eight feet from the water.

Besides the places already mentioned, the common rice thrives remarkably well in some parts of Europe, more especially in Spain, and Italy, and it is grown in Scotland; and has been sown, and succeeded, in several of the fenny and marshy grounds of England.

As an article of food, rice, when boiled, is considered extremely wholesome. When ground and mixed with flour of wheat, it affords excellent and nutritive bread. Rice is not comprehended under the general description, "corn," in a policy of insurance. *See titles, INSURANCE and POLICY.*

RICE FLOUR, (GER. *Reisblumen*, *Reismehl*. DU. *Rystmeel*. DA. *Riismeel*. SW. *Rismjöl*. FR. *Farine ou fleur de ris*. IT. *Farina o flor di riso*. SP. *Harina ó flor de arroz*. PORT. *Farinha ou flor de arroz*.) the grain of rice, freed from the husks, and reduced to flour by the action of a mill, or some other machine. It is used with wheat-flour in making bread. *See RICE.*

RIDDLE, a coarse or open sieve, composed of a circular wooden frame, and a bottom of strong iron-wire.

RIDE, in the sea language, is a term variously applied: thus, a ship is said to *ride*, when her anchors hold her fast, so that she does not drive by the force either of the wind

or tide. A ship is said to *ride across*, when she rides with her fore, and main, yards hoisted up to the hounds, and both yards and arms topped alike. She is said to *ride well*, when she is built so, as not to overbeat herself in a head-sea, the waves over-raking her from stem to stern. To *ride athwart*, is to ride with her side to the tide. To *ride betwixt wind and tide*, is to ride so, that the wind has equal force over her one way, and the tide the contrary way. If the wind has more power over the ship than the tide, she is said to *ride wind-road*, or to *ride a great wind*.

RIDERS, in a ship, are large timbers, both in the hold, and aloft, bolted on to other timbers to strengthen them, when the ship is discovered to be too slightly built.

RIFLE, a fire-arm which has the inside of its barrel cut with from three, to nine, or ten, spiral grooves, so as to make it resemble a female screw, varying from a common screw only in this, that its grooves or rifles are less deflected, and approach more to a right line; it being now usual for the grooves, with which the best rifled barrels are cut, to take about one whole turn in a length of thirty inches. The number of these grooves differs according to the size of the barrel, and fancy of the workman; and their depth, and width, are not regulated by any invariable rule.

RIGGING, in a ship, is all the cordage and ropes, belonging to her masts, yards, &c. *See SHIP-BUILDING.*

RIM, the edge or border of the circumference or circular part of a wheel.

RINE-HEMP, (GER. *Reinhanf*. DU. *Rynhennip*. DA. *Reenhamp*. FR. *Chanvre net*. PORT. *Linho canhamo da primeira sorte*.) so called from the German *Reinhanf*, is nothing more than the best sort of hemp, cleaned, or freed from every species of impurity, and from all foreign matter.

RINGS, (GER. *Ringe*. DU. *Ringen*. DA. *Ringe*. SW. *Ringar*. FR. *Bagnes*. IT. *Anelli*. SP. *Sortijas*. PORT. *Sortilhas*. RUSS. *Kulzii*. PERSIAN. *Perscenii*. POL. *Kolce*, *Pierscinie*.) in jewellery, are ornaments usually worn on the fingers, and so universally known as to require no minute description. Rings are mostly formed of gold, and are frequently set with diamonds, rubies, sapphires, pearls, and other scarce and valuable gems. Wedding-rings are entirely made of plain gold, without any peculiar embellishment. Mourning-rings are usually set with jet or some other black substance, whereon is engraven either a suitable axiom or poesy, or the name, condition, &c. of the person in memory of whom the ring is worn. Paris was long the chief seat of the manufacture of all articles of jewellery; but now London disputes the palm with the French capital.

RIVERS, it is almost unnecessary to observe, are always broadest at the mouth, and narrower towards their source; they run in a

more direct channel as they immediately leave their sources, and their sinuosities become more numerous as they proceed. We were taught by the savages of North America, that we are near the sea, when we find the rivers winding, and every now and then changing their direction. And this is now become the common indication to the Europeans themselves. As those sinuosities, therefore, increase as a river approaches the sea, it is not to be wondered at, that they sometimes divide, and thus disembogue by different channels. The Danube disembogues into the Euxine by seven mouths; the Nile by the same number; and the Wolga by seventy.

The largest rivers of *Europe* are, first, the *Wolga*, which is about six hundred and fifty leagues in length, extending from Reschow to Astrachan. The next in order is the *Danube*. The course of this is about four hundred and fifty leagues, from the mountains of Switzerland to the Black Sea. The *Don*, or *Tanais*, which is four hundred leagues from the source of that branch of it called the *Softna*, to its mouth in the Euxine Sea. The *Nieper*, or *Borysthenes*, which rises in the middle of Muscovy, and runs the course of three hundred and fifty leagues to empty itself into the Black Sea. The *Dwina*, which takes its rise in a province of the same name in Russia, that runs a course of three hundred leagues, and disembogues into the White Sea, a little below Archangel.

The largest rivers of *Asia* are, the *Hoang-ho* in China, which is eight hundred and fifty leagues in length, computed from its source at Raja Ribron, to its mouth in the Gulf of Changi. The *Jenisca* of Tartary, about eight hundred leagues in length, from the lake Selinga to the Icy Sea. The *Oby*, of five hundred leagues, running from the lake of Kila into the Northern Sea. The *Amour*, in Eastern Tartary, whose course is about five hundred and seventy-five leagues, from its source to its entrance into the sea of Kamschatka. The *Kiang-keou*, in China, five hundred and fifty leagues in length. The *Ganges*, one of the most noted rivers in the world, and about as long as the former. It rises in the mountains which separate India from Tartary; and discharges itself by several mouths into the bay of Bengal. Next to this may be reckoned the still more celebrated river *Euphrates*. This rises from two sources, northward of the city Erzerum, in Turcomania; and unites about three days' journey below the same, whence, after performing a course of five hundred leagues, it falls into the Gulf of Persia, fifty miles below the city of Bassura, in Arabia. The river *Indus* is extended, from its source to its discharge into the Arabian sea, four hundred leagues.

The largest rivers of *Africa* are: the *Gambia*, the *Senegal*, which runs a course of not less than eleven hundred leagues, and the *Niger*, whose extent is not yet ascertained.

The *Senegal* is well known to be navigable for more than three hundred leagues up the country; and how much higher it may reach is not yet discovered. The celebrated river *Nile* is said to be nine hundred and seventy leagues, from its source among the mountains of the Moon, in Upper Ethiopia, to its opening into the Mediterranean Sea. Besides the Nile in Africa, we may reckon *Zara*, and the *Coanza*, from the greatness of whose openings into the sea, and the rapidity of whose streams, we form an estimate of the great distance whence they come.

But of all parts of the world, *America*, as it exhibits the most lofty mountains, so also it supplies the largest rivers. The principal of these is the great river *Amazon*, which from its source in the lake of Lauricocha, to its discharge into the Western Ocean, performs a course of more than twelve hundred leagues. The breadth and depth of this river is answerable to its vast length; and, where its width is most contracted, its depth is augmented in proportion. So great is the body of its waters, that other rivers, though before the objects of admiration, are lost in its bosom. Another river, that may almost rival the former, is the *St. Lawrence*, in Canada, which rising in the lake Assiniboils, passes from one lake to another, from Christinaux to Alempigo; and thence to lake Superior; thence to the lake Hurons; to lake Erie; to lake Ontario; and, at last, after a course of nine hundred leagues, pours their collected waters into the Atlantic Ocean. The river *Mississippi* is more than seven hundred leagues in length, beginning at its source near the lake Assiniboils, and ending at its opening into the Gulf of Mexico. The river *Plata* runs a length of more than eight hundred leagues from its source in the river Parana, to its mouth. The river *Oroonoko* is seven hundred and fifty leagues in length, from its source near Pasto, to its discharge into the Atlantic Ocean.

Most of the rivers of Great Britain have been rendered navigable, and are protected by, divers local statutes, too numerous to be even referred to here. Besides these, however, there are very many statutes of a general and comprehensive nature, especially as they relate to the mouths of the larger and more important rivers of the kingdom, connected with its harbours, its arsenals, &c., which do claim some especial notice. These are chiefly, 10 Ann. c. 17. — 19 Geo. 2. c. 22. — 9 Geo. 3. c. 50. — 51 Geo. 3. c. 75. and 54 Geo. 3. c. 159.

The last-mentioned of these partially repeals the provisions of the former statutes, and lays down general regulations which are too numerous and too important to be epitomised. See 3 Dick. Pract. Expos. 655, and ante, title HARBOUR.

RIVET, a fastening pin, generally made of iron, clenched at both ends.

RIVETTER OF SADDLES, is a kind of smith, and is employed by the saddler in putting on the iron-plates for securing and strengthening the tree, and the stays for the stirrups, &c.

RIX-DOLLAR, is the name of an imaginary specie-money, as well as of a silver coin, in use and current in several parts of the world. In Holland the silver rix-dollar passes for 4s. $4\frac{1}{10}d.$; in Poland and Prussia, the imaginary rix-dollar is equivalent to 3s. 6d.; at Bazil, Zurich, and Zug, in Switzerland, the silver rix-dollar is current for 4s. 6d.; and at St. Gall, Appensel, &c. for 4s. 5d. only; the imaginary rix-dollar of Germany is reckoned at 3s. 6d. and the silver one at 4s. 6d.; in Sweden, the silver rix-dollar is current at 4s. 8d.; in Denmark and Norway, at 3s. $11\frac{1}{4}d.$; in Livonia, the imaginary rix-dollar is estimated at 5s. 6d.; and finally, in China, the silver rix-dollar, is current at 4s. $4\frac{1}{2}d.$ sterling.

RIX MARE, a copper coin of Denmark and Norway, current at $\frac{3}{4}$ of a penny, English.

RIX-ORT, a money of account used in Denmark and Norway, and estimated at $4\frac{1}{2}d.$ of our currency.

RIZE, a name given to a sack containing fifteen thousand ducats, in the late territories of the Grand Signior.

ROBE-MAKER, a kind of tailor, who makes the canonical habits of the clergy, robes of office, and professional attire of the judges and barristers, gowns of the liverymen, coronation-robes, dresses for the different orders of knighthood, &c. &c. This is accounted a lucrative trade, and there are not many who follow it in London.

ROCH, or **ROACH-ALUM**. (GER. *Weisser aluin*, *Felsenalun*. DU. *Witte aluin*, *Rotsalun*. DA. *Hvid alun*. SW. *Hvit alun*. FR. *Alun blanc*, *Alun de roche*. IT. *Allume di rocca*. SP. *Alumbre de roca*. PORT. *Pedra-hume de rocha*. LAT. *Alumen vulgare album*.) One of the most ancient alum-works of which we have any account, was that of the Roccha, now Edessa, a city of Syria; and from this city was derived the appellation of *roch alun*, a designation so little understood by the generality of people, that it has been supposed to signify *rock-alum*. See **ALUM**.

ROCHELLE-SALT. By saturating the superfluos acid of the supertartrate of potash with soda, a triple salt is formed, which crystallises in large regular prisms of eight nearly equal sides, of a bitter taste, efflorescent, and soluble in about five parts of water. It consists, according to Vauquelin of 54 parts tartrite of potash, and 46 tartrite of soda, and is in much repute as a purgative, by the name of Rochelle-Salt.

ROCK-CRYSTAL, (GER. *Bergkrystall*. DU. *Bergglas*. DA. *Biergkrystal*, *Klintkrystal*. SW. *Bergkristall*. FR. *Cristal de roche*. IT. *Cristallo di rocca*. SP. *Cristal de montano* &c.

de roca. PORT. *Cristal de roca*. RUS. *Gornii chrustal*. LAT. *Crystallus montana*.) is that supposed to be formed by a concretion of the lapidific fluid which trickles down in rocks and caverns. See **CRYSTAL**.

ROCK-MOSS. See **ORCHILLA**.

ROCK-OIL. See **PETROL**.

ROCK-SALT. See **SALT**.

ROCOU, *Roucou*, or *Rocoe*, are only other names for *annotto* or *anata*. See **ANATA**.

ROD, a land-measure of sixteen feet and a half; the same with the perch and pole.

ROE, of a fish, that part which contains the sperm or seed. The male fishes are usually distinguished by the name of soft roe or milt: the females, by hard roe or spawn. It is not unusual in some parts of Europe and America where extensive fisheries exist, to pickle the roes of various kinds of fish, and barrel them up for exportation: when thus prepared, they are considered a great delicacy. See title **CAVIARE**.

ROE-NENG, the largest measure for lengths and distances used in the kingdom of Siam, being the Siamese league, of nearly two thousand yards. There go to it twenty jods, four sens to the jod, twenty voua to the sen, and two ken to the voua. The ken is the Siamese ell.

ROLL, in manufactories, something wound and folded up in a cylindrical form.

Few stuffs are made up in rolls, except sattins, gauzes, and crapes, which are apt to break, and take plaits not easy to be got out, if folded otherwise. Ribbons, laces, galloons, and paduas of all kinds, are also thus rolled.

A roll of tobacco is tobacco in the leaf, twisted on the mill, and wound twist over twist, about a stick or roller. A great deal of tobacco is sold in America in rolls of various weights; and it is not till its arrival in England, Spain, France, and Holland, that it is cut. A roll of parchment properly denotes the quantity of sixty skins.

ROLLER, a piece of wood, iron, brass, &c. of a cylindrical form, used in the construction of several machines, and in various works and manufactures. The following is a brief description of the rolling-mill employed for flattening rods and bars of iron:

The rolling mill consists of two iron rollers, mounted in a strong frame of the same metal, which is composed of two distinct parts, both firmly fixed to an iron-floor; each part has a long mortice through it, in the bottom of which is a brass socket for the pivot of the lower roller, and in the upper part is the brass of the upper roller; this last brass is fixed to a piece of iron which slides up and down in the mortice, and is prevented from rising by the end of a strong screw, screwed through the upper part of the iron frame. The roller is prevented from falling in consequence of its own weight, by means of the brass in the under-

side of the pivot, which is attached by two screw-bolts to a collar fixed upon the screw that prevents the sliding piece of iron from rising, so that when the screws are turned by a handspike put between the teeth of a wheel which crowns that side of the frame wherein the pivots are deposited, the two rollers may be brought nearer together, or separated further asunder, as occasion requires. A stout iron bar, running parallel to the rollers, is fixed between the sides of the frame, by a wedge at each end, so that its upper surface is level with the top of the lower roller; at a small distance above this is another bar, fixed by two screws; between these are laid several blocks of iron, so as to fill up all the space, except a small opening, through which the bar to be flatted is introduced. At the top of the frame, running in a direct line between the two sides, is situated a narrow trough, bored full of holes, to which water is conveyed by a small pipe.

The upper roller is put in motion by a strong shaft, which, proceeding directly from the side of the frame opposite to that which sustains the pivots, turns another shaft, which like itself is provided with cogs, and is situated in a direct line with the axis of the lower roller. The machine is placed near to a furnace, where the iron bars to be rolled are heated to a welding heat; the mill is then put in motion, and the iron bars taken out of the furnace with a pair of pincers, and their heads put through the opening between the lateral bars already described, and thence between the rollers; which, as they turn round, squeeze the iron flat, and to the proper thickness throughout, while workmen behind the machine convey it away. The rolling mill is principally used for making hoops for barrels, and iron-plates. The water, brought by the small pipe to the trough, and thence let fall upon the roller, is to prevent the latter from being heated by the iron.

ROLLING-PRESS. *See* PRESS.

ROMAN VITRIOL, BLUE VITRIOL, or VITRIOL OF COPPER. (GER. *Blauer Vitriol*, *Kupfer Vitriol*, *Römischer Vitriol*. DU. *Blaauw Vitriool*, *Kopervitriool*, *Roomsch Vitriool*. DA. *Blaa Vitriol*, *Kobber Vitriol*, *Blaat Kobbevand*. SW. *Blå Vitriol*, *Koppar Vitriol*. FR. *Vitriol bleu*, *Couperose bleue*, *Vitriol Romain*, *Vitriol de Chypere*. IT. *Vitriolo turchino di rame, ciprio*. SP. *Vitriolo azul, de cobre, Romano, de Chipre*. PORT. *Vitriolo de cobre*. RUS. *Sinei Kupe-ros*. POL. *Koperwas cypryyski, modry*. LAT. *Vitriolum caruleum*, *Cyprinum*, *Romanum*, *veneris*.) If pure oil of vitriol be boiled in copper filings, or small pieces of that metal, it dissolves them into liquor of a deep blue colour, which readily crystallizes. The crystals are of a beautiful blue colour, and are sold under the name of Roman Vitriol, &c. Where sulphur is found in great plenty, Roman vitriol is made by stratifying

thin plates of copper with that mineral; and upon slow burning the latter, its acid corrodes the copper. The metal is then to be boiled in water, that the saline part may be dissolved. The operation is to be repeated till all the copper is dissolved, and all the saline liquors are to be evaporated together, to the crystallising point. By this method, however, a great part of the acid is lost; and in Britain, the pure acid *must* be preferable for those who prepare Roman Vitriol. It is used in dyeing, calico-printing, and paper-staining.

ROOD, a quantity of land equal to forty square perches, or the fourth part of an acre.

ROOTS of all kinds in the ground are specially protected by statute, either under their specific distinguishing appellations, or generally by their common denomination of *roots*. The 15 Geo. 3. c. 32. imposes a penalty of 10s. over and above the value of the things stolen, or commitment to hard labour for a month, upon the stealing and taking away, or the maliciously destroying, *turnips, potatoes, cabbages, parsnips, pease, or carrots*, growing or being in any garden, lands, or grounds open or inclosed.

The 6 Geo. 3. c. 48. imposes a penalty of 40s. over and above all costs, or similar commitment for a first offence, and additional punishments (even to transportation) for a repetition thereof, for plucking up, spoiling, destroying, taking, or carrying away, *any root, shrub, or plant*, out of any fields, nursery, garden, or other cultivated ground.

ROPE, hemp, hair, &c. spun into a thick yarn, and then several strings of this yarn twisted together by means of a wheel. When made very small it is called a cord, and when very thick, a cable. All the different kinds of this manufacture, from a fishing-line, or whip-cord, to the cable of a first-rate ship of war, go by the general name of cordage.

Ropes are made of every substance that is sufficiently fibrous, flexible, and tenacious, but chiefly of the inner barks of plants. The Chinese and other orientals even make them of the ligneous parts of several plants, such as certain bamboos and reeds, the stems of the aloes, the fibrous covering of the cocoonut, the filaments of the cotton pod, and the leaves of some grasses, such as the sparte. The aloe and the sparte exceed all others in strength. But the barks of plants are the most productive of fibrous matter fit for this manufacture. Those of the linden tree, of the willow, the bramble, the nettle, are frequently used; but hemp and flax are, on the whole, the best hitherto discovered for indiscriminate service; and of these the hemp is preferred, and employed in all cordage exceeding the size of a line, and even in many of this denomination. *See* CABLE, HEMP, and FLAX.

ROPE-MAKING, is an art of very great importance; and there are few which

better deserve attention. Hardly any art can be carried on without the assistance of the rope-maker. Cordage makes the very sinews and muscles of a ship; and every improvement which can be made in its preparation, either in respect to strength or pliability, must be of immense service to the commerce and the defence of nations.

The aim of the rope-maker is to unite the strength of a great number of fibres. This would be done in the completest manner by laying the fibres parallel to each other, and fastening the whole at the two ends; but this is impracticable, because the fibres are short, not exceeding three feet and a half on an average. They must therefore be commixed, so that the strength of a fibre shall not be able to draw it out from among the rest of the bundle. This is done by twisting or twining them together, in such a manner, as to produce reciprocal compression. When the fibres are so disposed in a long skein, that their ends succeed each other along its length, without many of them meeting in one place, and this skein is twisted round, we may cause them to compress each other to any degree desired; but if there be any one part where many ends of fibres meet, the skein will break in that part.

It is obvious that we can twist a skein of fibres so very hard, that it will break with any attempt to twist it harder. In this state all the fibres are already strained to the utmost. Such a skein of fibres can have no strength. It cannot carry a weight, because each fibre is already strained in the same manner, as if loaded with as much weight, as it is able to bear. What we have said of this extreme case is true in a certain extent of every degree of twist that we give the fibres. Whatever force is actually exerted by a twisted fibre, in order that it may sufficiently compress the rest to hinder them from being drawn out, must be considered as a weight hanging on that fibre, and must be deducted from its absolute strength of cohesion, before we can estimate the strength of the skein. The strength of the skein is the remainder of the absolute strength of the fibres, after we have deducted the force employed in twisting them together. From this observation may be established a fundamental principle in rope-making, that all twisting, beyond what is necessary for preventing the fibres from being drawn out without breaking, diminishes the strength of the cordage, and should be avoided.

It is necessary then to twist the fibres of hemp together, in order to make a rope; but we should make a very bad rope if we contented ourselves with twisting together a bunch of hemp sufficiently large to withstand the strains to which the rope is to be exposed. As soon as we let it go out of our hands, it would untwist itself, and be again a loose bundle of hemp; for the fibres are strained, and they are in a considerable degree elastic;

they contract again, and thus untwist the rope or skein. It is necessary to contrive the twist in such a manner, that the tendency to untwist in one part, may act against the same tendency in another, and balance it. The process, therefore, of rope-making is more complicated.

The first part of this process is spinning of rope-yarn, that is, twisting the hemp in the first instance. This is done in various ways, and with different machinery, according to the nature of the intended cordage. We shall confine our description to the manufacture of the larger kinds, such as are used for the standing, and running, rigging of ships.

An alley or walk is inclosed for the purpose, about two hundred fathoms long, and of a breadth suited to the extent of the manufacture. It is sometimes covered above. At the upper end of this rope-walk is set up the spinning-wheel. The band of this wheel goes over several rollers called whirls, turning on pivots in brass holes. The pivots at one end come through the frame, and terminate in little hooks. The wheel being turned by a winch, gives motion in one direction to all those whirls. The spinner has a bundle of dressed hemp round his waist, with the two ends meeting before him. The hemp is laid in this bundle, in the same way that women spread the flax on the distaff. There is great variety in this; but the general aim is to lay the fibres in such a manner, that so long as the bundle lasts, there may be an equal number of the ends at the extremity, and that a fibre may never offer itself double or in a bight. The spinner draws out a proper number of fibres, twists them with his fingers, and having got a sufficient length detached, he fixes it to the hook of a whirl. The wheel is now turned, and the skein is twisted, becoming what is called a rope-yarn, and the spinner walks backwards down the rope-walk. The part already twisted draws along with it more fibres out of the bundle. The spinner aids this with his fingers, supplying hemp, in due proportion, as he walks away from the wheel, and taking care that the fibres come in equally from both sides of his bundle, and that they enter always with their ends, and not by the middle, which would double them. He should also endeavour to enter every fibre at the heart of the yarn. This will cause all the fibres to mix equally in making it up, and will make the work smooth, because one end of each fibre is by these means buried among the rest, and the other end only lies outward; and this, in passing through the grasp of the spinner, who presses it tight with his thumb and palm, is also made to lie smooth. The greatest fault that can be committed in spinning, is to allow a small thread to be twisted off from one side of the hemp, and then to cover this with hemp supplied from the other side; for it is evident, that

the fibres of the central thread make very long spirals, and the skin of fibres which covers them must be much more oblique. This covering has but little connection with what is below it, and will easily be detached. But even while it remains, the yarn cannot be strong, for on pulling it, the middle part, which lies the straightest, must bear all the strain, while the outer fibres that are lying obliquely, are only drawn a little more parallel to the axis. This defect will always happen when the hemp is supplied in a considerable body to a yarn that is then spinning small. Into whatever part of the yarn it is made to enter, it becomes a sort of loosely connected wrapper. A good spinner therefore endeavours always to supply the hemp, in the form of a thin flat skein, with his left hand, while his right is employed in grasping firmly the yarn that is twining off, and in holding it tight from the whirl, that it may not run into loops or kinks.

It is evident, that both the arrangement of the fibres, and the degree of twisting, depend on the skill and dexterity of the spinner, and that he must be instructed, not by a book, but by a master. The degree of twist depends on the rate of the wheel's motion, combined with the retrograde walk of the spinner.

We may suppose him arrived at the lower end of the walk, or as far as is necessary for the intended length of his yarn. He calls out, and another spinner immediately detaches the yarn from the hook of the whirl, gives it to another, who carries it aside to the reel; and this second spinner attaches his own hemp to the whirl-hook. In the mean time, the first spinner keeps fast hold of the end of his yarn; for the hemp, being dry, is very elastic, and if he were to let it go out of his hand, it would instantly untwist, and become little better than loose hemp. He waits, therefore, till he sees the reeler begin to turn the reel, and he goes slowly up the walk, keeping the yarn of an equal tightness all the way, till he arrives at the wheel, where he waits with his yarn in his hand till another spinner has finished his yarn. The first spinner takes it off the whirl-hook, joins it to his own, that it may follow it on the reel, and begins a new yarn.

Rope-yarns, for the greatest part of the large rigging, are, from a quarter of an inch to somewhat more than a third of an inch in circumference, or of such a size that 160 fathoms weigh from $3\frac{1}{2}$ to 4 pounds when white. The different sizes of yarns are named from the number of them contained in a strand of a rope of three inches in circumference. Few are so coarse that 16 will make a strand of British cordage; 18 is not unfrequent for cable yarns, or yarns spun from harsh and coarse hemp; 25 is, we believe, the finest size which is worked up for the rigging of a ship. Much finer are indeed spun for sounding-lines, fishing-lines,

and many other marine uses, and for the other demands of society. Ten good spinners will work up above 600 weight of hemp in a day; but this depends on the weather. In very dry weather the hemp is very elastic, and requires great attention to make smooth work. In the warmer climates the spinner is permitted to moisten the rag, with which he grasps the yarn in his right hand, for each yarn. No work can be done in an open spinning-walk in rainy weather, because the yarns would not take on the tar, if immediately tarred, and would rot if kept on the reel for a long time.

The second part of the process is the conversion of the yarns into what may, with propriety, be called a rope, cord, or line. That we may have a clear conception of the principle which regulates this part of the process, we shall begin with the simplest possible case, the union of two yarns into one line. This is not a very usual fabric for rigging, but we select it for its simplicity.

When hemp has been split into very fine fibres by the hatchel, it becomes exceedingly soft and pliant, and after it has lain for some time in the form of fine yarn, it may be unreeling and thrown loose, without losing much of its twist. Two such yarns may be put on the whirl of a spinning-wheel, and thrown, like flaxen yarn, so as to make sewing thread. It is in this way, indeed, that the sail-maker's sewing thread is manufactured; and when it has been kept on the reel, or on balls or bobbins, for some time, it retains its twist, as well as its uses require. But this is by no means the case with yarn spun for great cordage. The hemp is so elastic, the number of fibres twisted together is so great, and the diameter of the yarn (which is a sort of lever on which the elasticity of the fibre exerts itself) is so considerable, that no keeping will make the fibres retain this constrained position. The end of a rope yarn being thrown loose, it will immediately untwist, and this with considerable force and speed. It would, therefore, be a fruitless attempt to twist two such yarns together; yet ingenuity has contrived to make use of this very tendency to untwist not only to counteract itself, but even to produce another and a permanent twist, which requires force to undo it, and which will recover itself when this force is removed. Every person must recollect that when he has twisted a packthread very hard with his fingers between his two hands, if he slacken the thread by bringing his hands nearer together, the packthread will immediately curl up, running into loops or kinks, and will even twist itself into a neat and firm cord.

The component parts of a rope are called strands, and the operation of uniting them with a permanent twist is called laying or closing, the latter term being chiefly appropriated to cables and other very large cordage.

Lines and cordage less than $1\frac{1}{2}$ inch circumference are laid at the spinning-wheel. The workman fastens the ends of each of two or three yarns to separate whirl-hooks. The remote ends are united in a knot. This is put on one of the hooks of a swivel called the loper, and care is taken that the yarns are of equal length, and twist. A piece of soft cord is put on the other hook of the loper; and, being put over a pulley several feet from the ground, a weight is hung on it, which stretches the yarn. When the workman sees that they are equally stretched, he orders the wheel to be turned in the same direction as when twining the yarns. This would twine them harder; but the swivel of the loper gives way to the strain, and the yarns immediately twist around each other, and form a line or cord. In doing this the yarns lose their twist. This is restored by the wheel. But this simple operation would make a very bad line, which would be slack, and not hold its twist; for, by the turning of the loper, the strands twist immediately together, to a great distance from the loper. By this turning of the loper the yarns are untwisted. The wheel restores their twist only to that part of the yarns that remains separate from the others, but cannot do it in that part where they are already twined round each other, because their mutual pressure prevents the twist from advancing. It is, therefore, necessary to retard this tendency to twine, by keeping the yarns apart. This is done by a little tool called the top.

It is a truncated cone, having three or more notches along its sides, and a handle called the staff. This is put between the strands, the small end next the loper, and it is pressed gently into the angle formed by the yarns which lie in the notches. The wheel being now turned, the yarns are more twisted, or hardened up, and their pressure on the top gives it a strong tendency to come out of the angle, and also to turn round. The workman does not allow this till he thinks the yarns sufficiently hardened. Then he yields to the pressure, and the top comes away from the swivel, which immediately turns round, and the line begins to lay. Gradually yielding to this pressure, the workman slowly comes up towards the wheel, and the laying goes on, till the top is at last close to the wheel, and the work is done. In the mean time, the yarns are shortened, both by the twining of each and the laying of the cord. The weight, therefore, gradually rises. The use of this weight is evidently to oblige the yarn to take a proper degree of twist, and not run into kinks.

A cord, or line, made in this way, has always some tendency to twist a little more. However little friction there may be in the loper, there is some, so that the turns which the cord has made in the laying, are not enough to balance completely the elasticity

of the yarns; and the weight being appended, causes the strands to be more nearly in the direction of the axis, in the same manner as it would stretch and untwist a little any rope to which it is hung. On the whole, however, the twist of a laid line is permanent, and not like that upon thread doubled or thrown in a mill, which remains only in consequence of the great softness, and flexibility, of the yarn.

The process for laying or closing large cordage, is considerably different from this. The strands, of which the rope is composed, consist of many yarns, and require a considerable degree of hardening. This cannot be done by a whirl driven by a wheel-band; it requires the power of a crank turned by the hand. The strands, when properly hardened, become very stiff, and when bent round the top, are not able to transmit force enough for laying the heavy and unpliant rope which forms beyond it. The elastic twist of the hardened strands must, therefore, be assisted by an external force. All this requires a different machinery, and a different process.

At the upper end of the walk is fixed up the tackle-board. This consists of a strong oaken plank called a breast-board, having three or more holes in it, fitted with brass or iron plates. Into these are put iron cranks, called heavers, which have hooks or fore-locks, and keys, on the ends of their spindles. They are placed at such a distance from each other, that the workmen do not interfere, while turning them round. This breast-board is fixed to the top of strong posts, well secured by struts or braces facing the lower end of the walk. At the lower end is another breast-board fixed to the upright posts of a sledge, which may be loaded with stones or other weights. Similar cranks are placed in the holes of this breast-board. The whole goes by the name of the sledge. The top necessary for closing large cordage is too heavy to be held in the hand: it therefore has a long staff, which has a truck on the end. This rests on the ground; but even this is not enough in laying great cables. The top must be supported on a carriage, for the purpose, where it must lie very steady, and it needs attendance, because the master-workman has sufficient employment in attending to the manner in which the strands close behind the top, and in helping them by various methods. The top is, therefore, fixed to the carriage, by lashing its staff to the two upright posts. A piece of soft rope, or strap, is attached to the handle of the top by the middle, and its two ends are brought back and wrapped several times tight round the rope, in the direction of its twist, and bound down. This both keeps the top from flying too far from the point of union of the strands, and brings the strands more regularly into their places.

The first operation is *warping* the yarns. At each end of the walk are frames called *warping-frames*, which carry a great number of reels or winches filled with rope-yarn. The foreman of the walk takes off a yarn-end from each, till he has made up the number necessary for his rope, or strand, and bringing the ends together, he passes the whole through an iron ring fixed to the top of a stake driven into the ground, and draws them through: then a knot is tied on the end of the bundle, and a workman pulls it through this ring till the intended length is drawn off the reels. The end is made fast at the bottom of the walk, or at the sledge, and the foreman comes back along the skeins of yarn, to see that none are hanging slacker than the rest. He takes up in his hand such as are slack, and draws them tight, keeping them so till he reaches the upper end, where he cuts the yarns to a length, again adjusts their tightness, and joins them all together in a knot, to which he fixes the hook of a tackle, the other block of which is fixed to a firm post, called the *warping-post*. The skein is well stretched by this tackle, and then separated into its different strands. Each of these is knotted apart at both ends. The knots at their upper ends are made fast to the hooks of the cranks in the tackle-board: and those at the lower end are fastened to the cranks in the sledge. The sledge itself is kept in its place by a tackle, by which the strands are again stretched in their places, and every thing adjusted, so that the sledge stands square on the walk, and then a proper weight is laid on it. The tackle is now cast off, and the cranks are turned at both ends, in the contrary direction to the twist of the yarns. (In some kinds of cordage the cranks are turned the same way with the spinning twist.) By this the strands are twisted, and hardened up; and as they contract by this operation, the sledge is dragged up the walk. When the foreman thinks the strands sufficiently hardened, which he estimates by the motion of the sledge, he orders the heavers at the cranks to stop. The middle strand at the sledge is taken off from the crank. This crank is taken out, and a stronger one put in its place. The other strands are taken off from their cranks, and are all joined on the hook which is now in the middle hole. The top is then placed between the strands, and being pressed home to the point of their union, the carriage is placed under it, and it is firmly fixed down. Some weight is taken off the sledge. The heavers now begin to turn at both ends. Those at the tackle-board continue to turn as they did before; but the heavers at the sledge turn in the opposite direction to their former motion, so that the cranks at both ends are now turning one way. - By the motion of the sledge-crank the top is forced away from the knot, and the rope begins to close.

The *neaving* at the upper end restores to the strands the twist which they are constantly losing by the laying of the rope. The workmen judge of this by making a chalk mark on intermediate points of the strands, where they lie on the stakes which are set up along the walk for their support. If the twist of the strands is diminished by the motion of closing, they will lengthen, and the chalk mark will move away from the tackle-board; but if the twist increases by turning the cranks at the tackle-board, the strands will shorten, and the mark will of course approach nearer to it.

As the closing of the rope advances, the whole shortens, and the sledge is dragged up the walk. The top moves faster, and at last reaches the upper end of the walk, the rope being now laid. In the mean time, the sledge has moved several fathoms from the place where it was when the laying began.

These motions of the sledge, and top, must be exactly adjusted to each other. The rope must be of a certain length. Therefore the sledge must stop at a certain place. At that moment the rope should be laid: that is, the top should be at the tackle-board. In this consists the address of the foreman. He has his attention directed both ways. He looks at the strands, and when he sees any of them hanging slacker between the stakes than the others, he calls to the heavers at the tackle-board to heave more upon that strand. He finds it more difficult to regulate the motion of the top. It requires a considerable force to keep it in the angle of the strands, and it is always disposed to start forward. To prevent or check this, some straps of soft rope are brought round the staff of the top, and then wrapped several times round the rope behind the top, and kept down by a lanyard or bandage. This both holds back the top, and greatly assists the laying of the rope, causing the strands to fall into their places, and keep close to each other, which is sometimes very difficult, especially in ropes composed of more than three strands. It will greatly improve the laying the rope, if the top has a sharp, smooth, tapering pin of hard wood, pointed at the end, projecting so far from the middle of its smaller end, that it gets in between the strands which are closing. This supports them, and makes their closing more gradual and regular. The top, its notches, the pin, and the warp or strap, which is lapped round the rope, are all smeared with grease or soap to assist the closing. The foreman judges of the progress of closing chiefly by his acquaintance with the walk, knowing that when the sledge is abreast of a certain stake, the top should be abreast of a certain other stake. When he finds the top too far down the walk, he slackens the motion at the tackle-board, and makes the men turn briskly at the sledge. By this the top is forced up the

walk, and the laying of the rope accelerates, while the sledge remains in the same place, because the strands are loosing their twist, and are lengthening, while the closed rope is shortening. When, on the other hand, he thinks the top too far advanced, and fears that it will be at the head of the walk before the sledge has got to its proper place, he makes the men heave briskly on the strands, and the heavers at the sledge-crank work softly. This quickens the motion of the sledge by shortening the strands; and by thus compensating what has been overdone, the sledge, and top, come to their places at once, and the work appears to answer the intention.

When the top approaches the tackle-board, the heaving at the sledge could not cause the strands immediately behind the top to close well, without having previously produced an extravagant degree of twist in the intermediate rope. The effort of the crank must therefore be assisted by men stationed along the rope, each furnished with a tool called a woolder. This is a stout oak stick, about three feet long, having a strap of soft rope-yarn, or cordage, fastened on its middle or end. The strap is wrapped round the laid rope, and the workman works with the stick as a lever, twisting the rope round in the direction of the crank's motion. The woolders should keep their eye on the men at the crank, and make their motion correspond with his. Thus they send forward the twist produced by the crank, without either increasing, or diminishing it, in that part of the rope which lies between them and the sledge.

Such is the general and essential process of rope-making. The fibres of hemp are twisted into yarns, that they may make a line of any length, and stick among each other with a force equal to their own cohesion. The yarns are made into cords of permanent twist by laying them; and that we may have a rope of any degree of strength, many yarns are united in one strand, for the same reason that many fibres were united in one yarn; and in the course of this process, it is in our power to give the rope a solidity and hardness which make it less penetrable by water, which would rot it in a short while. Some of these purposes are inconsistent with others, and the skill of a rope-maker lies in making the best compensation, so that the rope may, on the whole, be the best in point of strength, pliancy, and duration, that the quantity of hemp in it can produce.

The following rule for judging of the weight which a rope will bear is not far from the truth. It supposes them rather too strong; but it is so easily remembered that it may be of use.

Multiply the circumference in inches by itself, and take the fifth part of the product, it will express the tons which the rope will carry. Thus, if the rope has 6 inches cir-

cumference, 6 times 6 is 36, the fifth of which is $7\frac{1}{5}$ tons; apply this to the rope of $3\frac{1}{2}$, on which Sir Charles Knowles made his experiments $3\frac{1}{2} \times 3\frac{1}{2} = 10.25$, $\frac{1}{5}$ of which is 2.05 tons, or 4592 pounds. It broke with 4550.

This may suffice for an account of the mechanical part of the manufacture, according to the old-established process. In the last year of the last century, a new invention for making ropes and cordage, twined and untwined, from the spinning of the yarn inclusive, to the finishing of the rope or cordage, by means of machinery, was rewarded by a patent granted to two persons of the name of Chapman, of Newcastle-on-Tyne. It must have been noticed, by the foregoing description, that, according to the old method, rope-yarn, whether spun by hand-labour, or by machinery, is afterwards to be made into cordage by laborious, and expensive, hand-labour, in an extensive ropewalk, and by a comparatively slow process. The specification of Chapman's patent promises, by an easy and simple contrivance of machinery, to accomplish three desirable objects; viz. the substitution of the labour of women and children for that of men, great saving in extent of room, and the formation of a rope, in which all the component fibres, external, and internal, shall be obnoxious to a more equable pressure.

We have hitherto confined our observations only to the manufacture of ropes themselves; we must now say a few words on the adventitious aid sought from tar, and other things, in order to augment the strength and durability of cordage. Tarring is the process to which we particularly allude.

It is evidently proper to tar in the state of twine or yarn, this being the only way that the hemp could be uniformly penetrated. The yarn is made to wind off one reel, and having passed through a vessel containing hot tar, it is wound up on another reel; and the superfluous tar is taken off, by passing through a hole surrounded with spongy oakum; or it is tarred in skeins or hauls, which are drawn by a capstern through the tarketle, and through a hole formed of two plates of metal, held together by a lever loaded with a weight.

It is established beyond a doubt, that a tarred cordage, when new, is weaker than white, and that the difference increases by keeping. The following experiments were made by Mr. Du Hamel, at Rochefort, on cordage of three inches (French) in circumference, made of the best Riga hemp.

August 8. 1741.

White.	Tarred.
Broke with 4500 pounds.	3400 pounds.
4900	3300
4800	3250
April 25. 1745.	
4600	3500
5000	3400
5000	3400

Sept. 3. 1746.

5800	3000
4000	2700
4200	2800

A parcel of white and tarred cordage was taken out of a quantity which had been made Feb. 12, 1746. It was laid up in the magazines, and comparisons were made from time to time as follow :

	White bore.	Tarred bore.	Diff.
1746. April 14. 2645lbs.	2312lbs.		333
1747. May 18. 2762	2155		607
1747. Oct. 21. 2710	2050		660
1748. June 19. 2575	1752		823
1741. Oct. 2. 2425	1837		588
1749. Sept. 25. 2917	1865		1052

Mr. Du Hamel says, that it is decided by experience. 1. That white cordage in continual service is one-third more durable than tarred. 2. That it retains its force much longer while kept in store. 3. That it resists the ordinary injuries of the weather one-fourth longer.

We know this one remarkable fact: in 1758, the shrouds and stays of the sheer-hulk at Portsmouth dock-yard were overhauled, and when the worming and service were taken off, they were found to be of white cordage. On examining the store-keeper's books, they were found to have been formerly the shrouds and rigging of the Royal William, of 110 guns, built in 1715, and rigged in 1716. She was thought top-heavy, and unfit for sea, and unrigged, and her stores laid up. Some few years afterwards, her shrouds and stays were fitted on

the sheer-hulk, where they remained in constant, and very hard, service for about 30 years, while every tarred rope about her had been repeatedly renewed.

Why then do we tar cordage? It is chiefly serviceable for cables and ground tackle, which must be continually wetted, and even soaked. The result of careful observation is, 1. That white cordage, exposed to be alternately very wet and dry, is weaker than tarred cordage. 2. That cordage which is superficially tarred, is constantly stronger than what is tarred throughout, and it resists better the alternatives of wet and dry. The shrouds of the sheer-hulk were well tarred and blacked, so that it was not known that they were of white cordage.

Attempts have been made to increase the strength of cordage by tanning. But although it remains a constant practice in the manufacture of nets, it does not appear that much addition, either of strength or durability, can be given to cordage by this process. The trial has been made with great care, and by persons fully able to conduct the experiment with propriety. But it is found, that the yarns take so long time in drying, and are so much hurt by drying slowly, that the room required for a considerable rope-work would be immense; and the improvement of the cordage is but trifling, and even equivocal.

There are numerous statutes relative to the cordage of the royal navy (see *Dick. Pract. Expos.* 2 and 3, *title* CORDAGE,) but only one which relates to the manufacturing of it, and to prevent the illicit importation of it from foreign countries, which is 25 Geo. 3. c. 5, 6.

CORDAGE-TABLE; showing how many Fathoms, Feet, and Inches, of a Rope of any size, not exceeding fourteen inches, make a Hundred Weight; with the use of the Table.

Inches.	Fath.	Feet.	Inches.	Inches.	Fath.	Feet.	Inches.	Inches.	Fath.	Feet.	Inches.	Inches.	Fath.	Feet.	Inches.	Inches.
1	486	0	0	4 $\frac{1}{4}$	26	5	3	7 $\frac{1}{2}$	8	4	0	10 $\frac{3}{4}$	4	1	8	
1 $\frac{1}{4}$	313	3	0	4 $\frac{1}{2}$	24	0	0	7 $\frac{3}{4}$	8	3	6	11	4	0	3	
1 $\frac{1}{2}$	216	3	0	4 $\frac{3}{4}$	21	3	0	8	7	3	6	11 $\frac{1}{4}$	3	5	7

4	30	1	6	7 $\frac{1}{4}$	9	1	6	10 $\frac{1}{2}$	4	2	2	13 $\frac{3}{4}$	2	3	6	
												14	2	2	1	

At the top of the Table, marked inches, fathoms, feet, inches, the first column is the thick ness of a rope in inches and quarters; the other three the fathoms, feet, and inches, that make up a hundred weight of such a rope. One example will make it plain.

Suppose it is required how much of a 7-inen rope will make a hundred weight? Find 7, in the third column, under inches, or thickness of the rope, and against it, in the fourth column, you will find 9 5 6; which shows that, in a rope of seven inches, there will be 9 fathoms, 5 feet, 6 inches, required to make one hundred weight.

The Weight of any Cable, or Rope, of 120 fathoms in length, and for every half-inch, from 3 inches to 24 in circumference.

Inches.	Cwt.	Qrs.	Inches.	Cwt.	Qrs.	Inches.	Cwt.	Qrs.	Inches.	Cwt.	Qrs.	Inches.	Cwt.	Qrs.

A Table of the number of Threads and Weight of Cables, of different Circumferences.

Inches in Circumference.	No. of Threads.	Weight in lbs.
9	393	1527
10	485	1940
11	598	2592
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

By means of this table, the number of threads, &c. contained in cordage of whatever circumference, may be ascertained with facility. The examples which the above calculations afford, will serve as criterions for the working of all questions connected with the nature of the table.

ROSALGAR. See REALGAR.

ROSE, (GER. *Rosen*. DU. *Roos*. DA. *Rose*. SW. *Ros*. FR. *Rose*. IT. *Sp*. and PORT. *Rosa*. RU. *Rosa*, *Rosen*. POL. *Rosa*. LAT. *Rosa*.) a well-known flower, produced from a shrub of the same name.

The name of this plant in every language, both ancient, and modern, has its primary root in a term signifying *redness*. Of the *genus*, there are varieties of *species* almost innumerable. Among flowers, the rose stands pre-eminent for beauty and ornament; but for utility, its sphere is extremely limited. It is, in most of its varieties, a mild astringent, and for some purposes of delicate application in the form of a conserve, or in that of a liquid, by a distillation of its flowers, it is in general use. As an article of commerce, it scarcely presents itself to our notice,

further than as in distillation it is exported from Persia, in barter for the muslins of Hindostan, and is a perfume in great request throughout the East.

ROSE-NOBLE, an ancient English gold coin, first struck in the reign of Edward III. and then called the penny of gold, since called the rose-noble, because it was stamped with a rose: it was current at six shillings and eight-pence.

ROSE-WOOD. (GER. *Rosenholz*. DU. *Roxenhout*. DA. *Rosentræ*. SW. *Rosentrü*. FR. *Bois du rose*, *de Rhode*, *de marbre*. IT. *Legno rodie*. SP. *Leno de rosa*. PORT. *Páo de rosado*. LAT. *Lignum roseum*.) See RHODIUM.

ROSIN. See RESIN.

ROTA-TENT. See TENT.

ROTHER-NAILS, among shipwrights, nails with very full heads, used for fastening the rudder-irons of ships. See NAILS.

ROTOLO, (in the plural *ROTOLO*.) a weight used in Sicily, several parts of Italy, Portugal, Cairo, and other places in the Levant and Egypt, at Goa, &c. Its standard is widely different in most of these parts.

ROTTEN-STONE. See TRIPOLI.

ROUBLE, a silver coin of Russia, equivalent to 3s. 4d. sterling.

ROUGE, prepared from CARTHAMUS, which see. For this purpose the red colour is extracted by a solution of sub-carbonate of soda, and precipitated by lemon-juice, previously depurated by standing. This precipitate is dried on earthen plates, mixed with talc, or French chalk, reduced to a powder by means of the leaves of shave grass, triturated with it till they are both very fine, and then sifted. The fineness of the powder, and proportion of the precipitate, constitute the difference between the finer and the cheaper rouge. It is likewise spread very thin on saucers, and sold in this state for dyeing.

ROUGE, Polishing. This is a powder employed by goldsmiths to give the last polish to their work, which they commonly call colouring it. The finest is of a high red colour, and very soft to the touch. It is said to be a very pure native red oxide of iron. Sometimes it is of a red inclining to purple, and has the appearance of a very fine *crocus martis*: but this is of inferior quality. If pieces of old hat, in the dyeing of which iron is used, be immersed a few minutes in sulphuric acid, the iron will pass to the state of red oxide, and they will become excellent polishers.

ROUPEE, or RUPEE, a gold, and silver, coin, current in the East Indies and China. The golden roupee passes at Goa, Malabar, &c. for 1*l.* 16*s.*; at Guzurat, Surat, &c. for 1*l.* 15*s.*; and at Bombay, &c. for 1*l.* 15*s.* The silver roupee passes at Bengal, &c. at 2*s.* 6*d.*; and at Bombay, &c. at 2*s.* 3*d.* In China, the silver roupee is current at 2*s.* 6*d.*

ROWEL, the points of a spur turning on an axis.

ROWLEY RAG. This stone, which is a species of basalt, is of a dusky or dark-grey colour, with numerous minute shining crystals, some of which appear to be feldspar, the others hornblende. The town of Birmingham is paved with it.

Its texture is fine grained, and confusedly crystalized. By exposure to the air it acquires an ochrey crust.

RUBICELLE. This name has been applied to a red gem from Brazil, but authors do not agree in its characters. Some consider it as the Brazilian topaz, coloured red by the action of fire; while others say, that fire destroys the red colour.

RUBY, (GER. Rubin. DU. Robyn. DA. and Sw. Rubin. FR. Rubis. IT. Rubino. SP. Rubi. PORT. Rubim. RUS. Jachont tscherirtschatoi. POL. Rubin. LAT. Rubinus.) a genus of precious stones of various colours; as, 1. Of a deep red colour, inclining a little to purple: the carbuncle of Pliny. 2. The spinell, of the colour of a bright corn poppy flower. 3. The balass, or pale red, inclining to violet. The ruby is said to crystalize into an octahedral form, as well as the diamond, from which it differs very little in hardness, and weight. The hard and brilliant rubies, named oriental, as well as the sapphires and topazes, are all the same, excepting only the circumstance of colour. Some are partly red, and partly blue, yellow, and some quite colourless. The spinell rubies are about half the value of diamonds of the same weight; the balass is valued at 30 shillings per carat. Mention is made by travellers, of rubies exceeding 200 carats in weight. According to Dutens, a perfect ruby, if it weighs more than 5½ carats, is of greater value than a diamond of the same weight. If it weighs one carat, it is worth 10 guineas; if two carats, 40

guineas; three carats, 150 guineas; if six carats, upwards of 1000 guineas.

The ruby is usually found very small, equal to the head of the largest sort of pins; but sometimes of four, eight, and ten carats; and sometimes, though very rarely indeed, of twenty, thirty, and up to forty carats. It commonly is so naturally bright, that, when its figure will admit, it is set in its rough state.

The texture of the ruby is said to be foliated like that of diamonds, and fusible with borax in a strong, and long-continued, heat. It becomes electric, by being rubbed. Its specific gravity, according to Bergman, is from 3,180 to 4,240: but Brisson tells us, that it is 4,285. The specific gravity of the spinell is 3,760, of the Brazilian ruby, 3,531.

Rubies are met with in the Capelan mountains of Pegu, in the East Indies; and at Caas, Ava, Bisnagar, Calicut, Cananor, Ceylon, and Brazil. They are found in sands of rivers of a red colour, in an argillaceous earth of a hard texture, and greenish colour; sometimes they adhere to red rocks. The spinell rubies are met with in Hungary, Silesia, Bohemia, and Brazil. The balass comes principally from Brazil, though some are also brought from the East Indies.

The ruby seems to owe its colour to gold, it being possible to separate a small portion of that metal from the small native rubies, and also to give the true colour of these gems to a factitious paste, by means of gold.

RUDDER, in navigation, a piece of timber turning on hinges in the stern of the ship, and which, opposing sometimes one side of the water, and sometimes another, turns or directs the vessel this way or that. See SHIP-BUILDING.

The rudder of a ship is a piece of timber hung on the stern-posts by four or five iron hooks, called pintles, serving for the bridle of a ship to turn her about, at the pleasure of the steersman. The rudder being perpendicular, and withoutside the ship, another piece of timber is fitted to it at right angles, which comes into the ship, by which it is managed and directed. This latter property is called the helm or tiller; and sometimes, though improperly, the rudder itself. The power of the rudder is reducible to that of the lever. As to the angle the rudder should make with the keel, it is shewn, that the working of ships, in order to stay, or bear up, the soonest possible, the tiller of the rudder ought to make an angle of fifty-five degrees with the keel. A narrow rudder is best for a ship's sailing, provided she can feel it; that is, be guided and turned by it: for a broad rudder will hold much water when the helm is put over to any side; but if a ship has a fat quarter, so that the

water cannot come quick and strong to her rudder, she will require a broad rudder. The aft-most part of the rudder is called the rake of the rudder.

RUDDLE. See **REDDLE**.

RUE, Meadow. The root, branches, and leaves of this plant impart to wool a yellow colour: which, on adding sal-ammoniac, assumes a pale shade; and, on dropping oil of tartar into the decoction, acquires an orange shade: but, in order to give it lustre, the cloths should be immersed in alum-water, and the tint itself may be fixed by dissolving cream of tartar in the last liquor.

RUG, a sort of carpet in which the wool is thickly worked, and the fibres are permitted to stand erect so as to form a warm foot-cloth. Rugs are generally made to fit hearth-stones, over which they are laid during the winter season. Some of these articles are beautifully executed at Kidderminster; and are much in vogue.

RUG is also a coarse nappy coverlet, generally composed of yellow, and red, worsted, and used as a covering for inferior beds.

RULE, or **RULER**, an instrument of wood or metal, with several lines delineated on it, of great use in practical mensuration.

When a ruler has the lines of chords, tangents, sines, &c., it is called a plane scale.

The carpenter's joint-rule is an instrument usually of box, &c., twenty-four inches long, and one and a half broad; each inch being subdivided into eight parts. On the same side with these divisions, is usually added Gunter's line of numbers. On the other side are the lines of timber and board measure; the first beginning at 82, and continued to 36, near the other end: the latter is numbered from seven to 36, four inches from the other end.

Use of the carpenter's joint-rule. The application of the inches, in measuring lengths, breadths, &c., is obvious.

The use of the other side is all we need here to notice. 1. The breadth of any surface, as board, glass, &c., being given, to find how much in length makes a square foot. Find the number of inches the surface is broad, in the line of board measure, and immediately against it is the number of inches required. Thus, if the surface was eight inches broad, eighteen inches will be found to make a superficial foot. Or more readily thus: Apply the rule to the breadth of the board, or glass, that end marked 36 being equal with the edge, the other edge of the surface will shew the inches, and quarters of inches which go to a square foot. 2. Use of the table at the end of the board measure. If a surface be one inch broad, how many inches long will make a superficial foot? look in the upper row of figures for one inch, and under it, in the second row, is twelve inches, the

answer to the question. 3. Use of the line of timber measure. This resembles the former; for having learned how much the piece is square, look for that number on the line of the timber measure; the space thence to the end of the rule is the length which, at that breadth, makes a foot of timber. Thus, if the piece be nine inches square, the length necessary to make a solid foot of timber is $21\frac{1}{3}$ inches. If the timber be small, and under nine inches square, seek the square in the upper rank of the table, and immediately under it are the feet, and inches, that make a solid foot. If the piece be not exactly square, but broader at one end than the other, the method is to add the two together, and take half the sum for the side of the square. For round timber the method is to girt it round with a string, and to allow the fourth part for the side of the square; but this method is erroneous, for hereby you lose nearly one-fifth of the true solidity; though this is the method commonly practised in buying, and selling, timber.

The mason's rule is twelve, or fifteen feet long, in order to be applied under the level to regulate the courses, and make the piers equal, &c.

RULE OF THREE, in arithmetic, is so called, because by three numbers being given, we find a fourth; and it is divided into the rule of three direct, inverse, and the double rule of three.

RUM, (*GER. and DU. Rum. DA. Rom. Sw. Rom. Rum. FR. and IT. Rum. SR. Ron, Rom. PORT. Ron. RUS. Rom.*) a well known spirituous liquor made in the West Indies from the sugar-cane, &c. It is in general of a stronger body than brandy; that is, it contains a larger quantity of oil, and less phlegm and salt.

The method of making rum, as practised in the West Indies, is as follows: When a sufficient stock of the materials is got together, they add water to them, and ferment them in the common manner. When the wash is fully fermented, or to a due degree of acidity, the distillation is carried on in the common way, (*See DISTILLATION.*) and the spirit is made proof; though sometimes it is made up to a much greater strength, nearly approaching that of alcohol, and it is then called double distilled rum.

It would be easy to rectify the spirit, and bring it to a much greater purity than we usually find it to be; for it brings over in the distillation a very large quantity of the oil, and this is often so disagreeable, that the rum must be suffered to mellow by age, before it can be used; whereas, if well rectified, it would grow mellow much sooner, and would have a much less potent flavour. If the business of rectifying were more nicely attended to, it seems very practicable to throw out so much of the oil, as to have it in the fine light state of a spirit. The ingredients

used in the making of genuine rum, are the raw juice of the sugar-cane, and parts of the cane itself fermented in the liquor.

Rum is usually very much adulterated in England. Sometimes with malt spirit; but if done with molasses spirit, the tastes of both are so nearly allied, that the cheat is not easily discovered.

The rum, which is of a brownish, transparent colour, of a smooth oily taste, of a strong body and consistence, of a good age, and well kept, is the best. That of a clear, limpid colour, and hot pungent taste, is either too new, or dashed with other spirits.

The best state in which rum can be imported, or preserved, is that of rectified spirit, as it may thus be conveyed in one half of its usual compass, and afterwards reduced to the proper degree of proof strength, by means of spring water.

Jamaica rum is the first in point of quality, imported into this country; the Leeward Island rum, as it is called, being always inferior to it, both in flavour, strength, and value. The price of the latter is usually 20 per cent below that of the former. We import all our rum in puncheons, containing from 84 to 90 gallons, each.

It is customary in some of the West India islands, to put sliced pine apples in the puncheons of rum designed as presents for European friends; this gives the spirit a very agreeable flavour, and hence we have the designation of *pine-apple rum*. Rum being the staple produce of our West India islands, is the subject of divers statutes, as well protecting, as prohibitory. See title SHIP-PING and TRADE.

RUNDLET, or RUNLET, a small vessel containing an uncertain quantity of any liquor, from three, to twenty, gallons.

RUNNER, in the sea language, a rope belonging to the garnet, and to the two bolt-tackles. It is reeved in a single block, joined to the end of a pennant, and has at one end a hook to hitch into any thing, and at the other end a double block, into which is received the fall of the tackle, or the garnet, by which means it purchases more than the tackle would without it.

RUNNET, or RENNET, is the juice, or gastric fluid, found in the stomachs of sucking quadrupeds, which as yet have received no other nourishment than their mother's milk. It is used to curdle milk, by means of which process it is that cheese is made.

RUNNING OF GOODS, is a clandestine landing of goods, without paying the legal customs of duties for the same. See SMUGGLING.

RUNSTIC, a Swedish money of account, equivalent to 7-30ths of a penny, sterling.

RUPEE. See ROUPEE.

RUSH, (GER. *Binsen*. DU. *Bies*. DA. *Sw.* *Sw.* *Säf*. FR. *Jonc*. IT. *Güinco*.

SP. and PORT. *Junco*. RUS. *Ossethäg*. POL. *Sitowie*, *Sit*. LAT. *Juncus*.) a well known vegetable production, usually found growing in marshy lands. The pith of two kinds of rushes, namely, those called round headed and soft rushes, is used for wicks to lamps and rushlights. The marine rush is planted with great care, on the banks of the sea, in Holland, in order to prevent the water from washing away the earth, which, if it were not for the roots of these plants, would be removed every tide. In the summer-time, when these rushes are fully grown, they are cut and tied up in bundles, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into baskets and other useful things, which are frequently sent into England.

RUSSIA-COMPANY. See COMPANY.

RUSSIA LEATHER, (GER. *Juften*. DU. *Jucht*, *Jugt*. DA. *Ruslæder*, *Ryslæder*, *Juchter*. SW. *Jufter*, *Juchter*, *Ryska hudar*. FR. *Cuir de Russie*, ou de *Roussi*. Vache de *Russie*. IT. *Cuojo di Russia*, *Vacchalle di Moscovia*. SP. and PORT. *Moscovia*. RUS. *Juft*. POL. *Juchta*.) is prepared from the hides of kine, and comes to us ready dressed from Russia. This is the leather which the Russians call *Youft* (in the plural *Youfti*), a word denoting that the Russian skins are usually assorted in couples. There are very few towns in Russia in which this species of leather is not prepared, but that which is manufactured at Jaroslau is accounted the best. In foreign countries, as well in Europe, as in Asia, the red leather is most esteemed, being admirably calculated for book-binding. In Russia, however, the black leather is in the greatest demand, vast quantities of it being employed in the formation of boots and shoes. It is probable that the Tartars were formerly masters of this branch of industry, and that from them the Russians have obtained the secret, whereby they are enabled to give their skins that lustre, softness, and strongly prominent grain, which other Europeans have vainly attempted to imitate.

The annual exportation of Russia leather, forms a considerable article in the revenues of the country.

Purchasers of Russia leather ought to pay particular regard to the weight of the bales; and especially, they ought to see that the bales have not been unpacked on the voyage. A bale containing 20 rolls, usually weighs 30 pounds, each roll consisting of from 3 to 5 skins, according to the quality of the article. The bales sent to Hamburg and Lubeck, are commonly of this weight. The bales exported to Italy contain the finer sorts of skins, of which 22 rolls go to a bale. Petersburg is the grand mart of the leather-trade; and the most favourable period for making purchases is about Novem-

ber, immediately after the arrival of the Archangel fleet.

RUST, the oxide of a metal. Iron, for instance, when exposed to the air, soon becomes tarnished, and gradually changed into a brown, or yellow, powder, well known by the name of rust. This change is occasioned by the gradual combination of the iron with the oxygen of the atmosphere, and according to the new chemistry, it is now denominated the oxide of iron.

Rust may be removed from iron by combining a certain proportion of quick-lime with mutton fat, and making it into balls, which must be rubbed upon the utensil till it has entirely obliterated the rust.

After this coating has remained for a few days on the metal, it is removed with coarse flannel or other rag, when another composition made of equal parts of charcoal, calx of vitriol, and drying oil, is applied by friction till the surface is restored to its former brightness.

RYAL. See **RIAL**.

RYDER. See **REYDER**.

RYE, (GER. *Roggen*, *Rocken*. DU. *Rog*, *Rogge*. DA. *Rug*. SW. *Råg*. FR. *Seigle*. IT. *Segale*, *Segala*. SP. *Centeno*. PORT. *Senteio*, *Centeo*. RUS. *Rosch*, *Sel*. JAR. POL. *Rez*, *Zito*. LAT. *Secale*.) The plant which produces this well known and useful species of grain is a native of the island of

Candia, and was introduced into England, and the north of Europe, many years ago. There are two varieties, the winter, and spring-rye. The winter-rye, which is larger than the spring rye, is sown in autumn, at the same time with wheat. The spring-rye, which is sown along with the oats, usually ripens as soon as the winter-rye; but the grain produced being lighter, is seldom sown, except where the autumnal crop has failed. Rye is commonly used in making bread, either alone, or mixed with wheat. The consumption of this article is particularly great in the northern Counties. Rye is frequently imported into Great Britain from Russia.

Rye is subject to a disease, which the French call *ergot*, and the rye which has it, is called by the English *horned-rye*. This commonly arises from a hot summer succeeding a rainy spring. Horned-rye is such, as suffers an irregular vegetation, in the middle substance between the grain and the leaf, producing an excrescence of a brownish colour, about an inch and a half long, and two-tenths of an inch broad. Bread made of this rye has an acrid nauseous taste, and is said to be unwholesome even to poultry. In modern husbandry, it is not unusual to sow rye for early spring herbage to be eaten green, and very prolific it is.

S A B

S A B

S, the eighteenth letter of the alphabet, as a numeral, formerly stood for seven. **S. A.** in medicinal prescriptions, is an abbreviation of *Secundum Artem*, "according to art;" chiefly used where uncommon care and dexterity are required.—**S. S. S.** *Stratum super Stratum*, or layer upon layer.—In navigation, **S.** stands for South, **S. E.** South-east; **S. W.** South-west; **S. S. E.** South-south-east; **S. S. W.** South-south-west, &c.

SABLE, (GER. *Zobel*. DU. *Sabel*. DA. *Zobel*. SW. *Sabel*. FR. *Zibelline*, *Marte Zibelline*. IT. *Zibellino*. SP. *Cebellina*, *Marta*, *Cebellina*. PORT. *Zebetina*, *Zibellina*. RUS. and POL. *Sohol*. LAT. *Zibellina*, *Zobela*.) an animal chiefly esteemed on account of its fur, which bears the same name. It is the nature of this creature, at a certain time of the winter, to fall into an absolute state of torpitude; but it previously hides itself so securely, that it is very difficult to find it. When discovered, it is found wrapped up like a ball, and may be rolled and thrown about without being awakened.

The sable lives upon mice, fish, cedar-kernels, and red-berries. When these last are most plenty, the animal is difficult to be found, and its fur is then worse than at any other time; because, feeding plentifully, it rests more than usual; and, on the contrary, if there be a scarcity of berries, it runs more about, is consequently caught with greater facility, and exercise improves the quality of its fur. The most beautiful sable-skins have generally the worst tails; and, *vice versâ*, the worst skins have the best tails. There are sables as white as snow, but they are met with very rarely. Upon the islands in the North-eastern Sea, beyond Kamtschatka in Russia, the sables are very indifferent; but then they have the tails a quarter of a Russian ell long, streaked red and black. Near Crasnoyahr, Abakan Kuanetsko, and some other places, you may buy a hundred of the best sable tails for about six or eight roubles; whereas they are worth from twenty-five, to thirty, at Tobolska, and will sell for one hundred at Moscow. The skins bear the same propor-

tion. They are oftentimes met with of a fine glossy black hue, and the fur of this kind is invariably looked upon as the most valuable.

Hudson's bay, and Canada, are the parts of North America which furnish us with sables, but those of the former are far superior to the latter. The colour of the North American skins is generally dark-flaxen. A *timber* of sables consists of 40 skins, or 20 coup.

SABRE, a short curved sword, with a convex edge, usually worn by officers of the light-infantry companies.

SACARE, a small weight used in Madagascar, for gold and silver, being equal to an European scruple.

SACBUT, a bass wind-instrument, resembling the trumpet, so contrived as to be capable of being drawn out to different lengths, according to the acuteness, or gravity, of the scale required. The sacbut is usually about eight feet long, and when extended to its full length, about fifteen. There are, however, sacbuts of different sizes to execute different parts; particularly a small one, called by the Italians *trombone piccolo*, and by the Germans *kleine alt posaune*, proper for the counter-tenor.

SACK of Wool, a quantity of wool, containing two ways, or twenty-six stone, every stone fourteen pounds. Twelve sacks make the *last*. In Scotland, a sack is twenty-four stone, each stone containing sixteen pounds.

SACK of cotton Wool, a quantity from one hundred and a half to four hundred weight.

SACK of Coals, is three pecks, or four bushels; twelve sacks making the chaldron. It is to be observed that, in the purchasing of coals, to a single chaldron there are twelve sacks only; but if five chaldrons be ordered at one time, the seller must send sixty-three sacks. 47 Geo. 3. c. 68.

SACK, or **CANARY**, a sort of sweet white wine, brought to us from the Canary Islands. This wine is chiefly produced in the island properly called Canary, and although it is not so full bodied as the wine called Vidonia, it is far more palatable. Tercera is also noted for producing excellent sack.

SACK-CLOTH, (GER. *Sacktinnen*. DU. *Zakdoek*. DA. *Sackelæred*. SW. *Blagarnsväf*, *Säckväf*. FR. *Toile à sac*, *Grosse toile*. IT. *Sacco*. SP. *Brea*. PORT. *Barras*, *Calhamace*, *Estopas*, *Grossarias*. RUS. *Chräschtsh*. POL. *Part*, *Plotno grubo*.) the coarse kind of hempen cloth used in the manufacture of sacking. A great part of the sackcloth consumed in Great Britain is imported from Germany, via Hamburg. This cloth is principally manufactured in Hesse, and Hanover. Considerable quantities are also made in the northern, and midland, counties of England.

SADDLES, (GER. *Sattel*. DU. *Zadels*. DA. *Sadler*. SW. *Sadlar*. FR. *Selles*. IT.

Selle. SP. *Selles*. PORT. *Sellas*. RUS. *Sädla*. POL. *Siódla*.) seats adapted to the horse's back, for the convenience of the rider. They consist of a wooden frame called the saddle-tree, on which is laid a quantity of horse-hair, wool, &c. this is covered over with tanned leather, which is fastened by nails to the tree. Cutting-knives, hammers, and pincers, are the chief implements of the sadler. To complete the article, the aid of many different artisans is required. The tree-maker furnishes the wooden part of the saddle; this is, however, a very important branch of the business, because upon its accuracy, the fitting of the saddle depends. The sadler's ironmonger furnishes him with the iron or steel stirrups, buckles of all kinds, bits for bridles, and other steel or brass furniture required for the harness of a horse, either for riding or drawing in a carriage. There is also a distinct trade called a horse's milliner, who makes roses for bridles, and other articles used in highly-ornamented caparisons. The sadler makes all sorts of bridles, coach and chaise harness, &c. A great number of saddles are exported to the countries of continental Europe, and to the East Indies, where English-made saddles are in great repute. There are many different kinds of saddle, as the hunting-saddle, the racing-saddle (which is generally very small), the ladies', or side-saddle, &c. The figures of these are so generally known as to demand no particular descriptions in this place.

SAFE CONDUCTS AND PASSPORTS. These are securities given by his majesty, under the great seal of England, to a stranger, for his safe coming into, and passing out of, the realm.

Passports, however, under the king's sign manual, or licenses from the ambassadors abroad, are not only more usual, but obtained with more facility.

It has been observed, by the enlightened author of "The Spirit of Laws," in compliment to the English government, that the protection of foreign merchants is a part of the British constitution, and that their security constituted a condition of *Magna Charta*, by an article of which, all merchants (unless publicly prohibited) shall have safe conduct to depart from, come into, tarry in, and go through, England, for the exercise of merchandise, without any unreasonable imposts, except in time of war.

Subjects of his majesty attempting to offend upon the sea, or in any part under the king's obedience, against any stranger in amity, or under safe conduct, but especially by attacking his person, or spoiling him, or robbing him of his goods, the Lord Chancellor, with any of the judges, may cause full restitution and amends to the party injured.

The above are the only regulations now remaining relative to this article.

SAFFLOWER, or BASTARD SAFFRON, (GER. *Safflor*. DU. *Saffloer*, *Floers*, *Basterd*, *Saffran*. DA. *Safflor*, *Uegte Saffran*. SW. *Safflor*, *Oägt Saffran*. FR. *Cartame*, *Saffran batard*. *Saffran d'Allemagne*, *Saffranon*. IT. *Zaffrone*, *Zafferano saracinesco*. SICIL. *Ufharu*. SP. *Alazor*, *Azafran bastardo*, *Cartamo*. PORT. *Açafroa*, *Azafroa*, *Cartamo*, *Fusaro*. RUS. *Polerroi*, *Prostoi schafraan*. POL. *Szafran polny*, *Krokos*. LAT. *Carthamus tinctorius*, *Saffranum*.) is the florets of the flower of the *carthamus tinctorius*, a plant originally growing in Egypt, and some of the warm parts of Europe, especially Spain; and also in the Levant, whence large quantities are annually imported into Great Britain. The good quality of this commodity is known by a bright colour of a saffron hue. If there happen to fall much rain during the time the plants are in flower, or if the flowers are gathered with any moisture adhering to them, they change to a dark dirty yellow.

Safflower was formerly cultivated in Thuringia and Alsatia; but the preference given to that of the Levant has occasioned its culture to be nearly abandoned in the more northern climates.

Safflower contains two kinds of colouring matter; the one yellow, the other red. The first alone is soluble in water: its solution is always turbid: with re-agents it exhibits the appearances commonly observed in yellow colouring matter: acids render it lighter; alkalis make it deeper, and more approaching to orange: both produce a small portion of fawn-coloured precipitate, by means of which it becomes clearer. Alum forms with it a deep yellow precipitate in small quantity; solution of tin, and other metallic solutions, precipitates which have nothing remarkable.

Alcohol requires but a slight tincture from the flowers, after all the yellow substance has been extracted by repeated washings. If these flowers be put into a solution of caustic alkali, they become yellow; and the liquor which is pressed out is of a deep yellow colour. On saturating the alkali with an acid, the liquor becomes turbid, reddish, and gradually deposits a very small quantity of a reddish yellow precipitate. With solutions of alum, zinc, and tin, a yellow precipitate is formed; and with solutions of iron and copper, a precipitate inclining to green. If instead of a solution of caustic alkali, a solution of mild alkali be used, acids produce with it a more copious precipitate, of a redder hue; but the redness differs according to the acid employed. Alum also produces with the latter alkaline solution, a red precipitate, which is so light, that it generally swims on the surface of the liquor. This colouring matter is so delicate, and so easily changed, that, if heat be employed to dissolve it, the precipitates produced by acids will not have so fine a colour.

If the safflower of the Levant, such as it is in commerce, be compared with that of Thuringia, the former will be found to be more pure, a little moist, and in compressed masses; the latter drier, and more elastic. These differences depend on the preparation. See DYEING.

SAFFRE. See ZAFFRE.

SAFFRON, (GER. *Saffran*. DU. *Saffraan*. DA. and SW. *Saffran*. FR. *Safran*. IT. *Zafferano*. SP. *Azafran*. PORT. *Açafrão*. RUS. *Schafraan*. POL. *Szafran*. LAT. *Crocus*.) a bulbous plant, of which there are two species, one blowing in spring, and the other in autumn. The former is merely esteemed on account of the beauty of its flowers; the latter is in blossom earlier than the green leaves appear, which remain during winter, and the flowers contain those small threads or filaments used for sundry purposes. There are three varieties of this species of saffron to be met with in the shops, two of which are brought from abroad, the other is the produce of our own country: this last is greatly superior to the former, from which it may be distinguished by its blades being rather broader. When in perfection, it is of a fiery orange red colour, and yields a deep yellowish tincture; it should be chosen fresh, not above a year old, in close cakes, neither dry, nor yet very moist, tough and firm in tearing, of the same colour within as without, and of a strong, acrid, diffusive smell.

It appears that the medicinal use of this plant always continued among the Orientals. The Europeans who adopted the medicine of the Greeks, sent to the Levant for saffron, until they learned the art of rearing it themselves; and employed it very much till they were made acquainted with more beneficial articles. Its introduction into England, we are assured, was from the Levant, in the reign of Edward III. A great part of the saffron consumed in this country is brought from France and Spain, but there is likewise abundance of the article cultivated in several parts of Britain, especially in Essex. One million eight hundred thousand pounds of saffron are annually prepared in Egypt; the greater part of which goes to Marseilles, and Italy, the rest to Syria, and Arabia. The best of the Egyptian saffron grows in the vicinity of Cairo, that of Upper Egypt is not reckoned so good. The best French saffron is that grown in Gatinais, Italy, Switzerland, Germany, and Ireland, produce excellent saffron.

Saffron is used in medicine. A strong infusion of it in water is used in colouring maps. It is also employed with success in dyeing, being esteemed a good yellow.

SAGATHEE, a slight woollen stuff, being a kind of serge, or ratteen; sometimes mixed with a little silk. It was originally manufactured at Amiens, in France, but

for several years past it has been wrought in England.

SAGO, (GER. *Sago*. DU. *Sagoe*. DA. *Sago*, *Sagogryn*. SW. *Sagogryn*. FR. *Sagou*. IT. SP. and PORT. *Sago*.) This is the produce of an oriental tree, the *cycas circinalis*, which has generally been considered as belonging to the palms, though some have classed it as a fern. According to Petit-Thouars, however, it forms a class distinct from both.

The pith of a tree of a middle age or growth, is beaten with water, and made into cakes, which are used by the Indians as bread. They likewise put the powder into a funnel, and wash it with water over a hair-sieve, which allows only the finer part to pass through the water. The water, on standing, deposits the fecula; which, being passed through perforated copper-plates, is formed into the grains called sago.

The sago-tree grows spontaneously and in great abundance in several parts of India, but particularly in the Molaccas, and on the coast of Malabar. It is a most valuable tree to the inhabitants of those parts.

Sago forms an agreeable jelly with water, milk, or broth, and is extremely palatable when mixed with a little port-wine. It is much used in phtisical, and convalescent, cases.

There is a sort of sago brought from the West Indies, but it is far inferior to that imported from the East. This is supposed to be made from the pith of the *areca oleracea*.

SAIK, or **SAIQUE**, a Turkish vessel very common in the Levant, used for the conveyance of merchandise.

SAIL, the expanded sheet which catches the wind, and carries the vessel on the water. The sails of a ship are of different forms, according to the uses for which they are intended; thus some are square, others cut in shoulder-of-mutton fashion, others in a triangular shape, &c. Every sail is named from the situation it occupies; as the main-sail, main-top-sail, fore-sail, &c. which see under their separate heads. See also SHIP-BUILDING.

SAIL is also a name applied to any vessel seen at a distance *under sail*.

To *set sail* is to unfurl and expand the sails.

To *make sail* is to spread an additional quantity of sail, so as to increase the ship's velocity.

To *shorten sail* is to reduce, or take in, part of the sails, so as to diminish the ship's velocity.

To *strike sail* is to lower the sail suddenly.

Every master of a vessel belonging to any of his majesty's subjects, navigated with, or having on board, any foreign-made sails, is, at the time of reporting his ship, to make an entry and report, on oath, of every such sail, and before the ship is cleared to pay duty for them, under penalty of forfeiture of sails, and a fine of 50*l.* for every offence,

by the master; and such sails are to be stamped at the port of entry in the same manner as foreign sail-cloth.

But if the master, before the ship is cleared, declares his intention of not paying the duty, and delivers up the sails to the officers of the customs, the sails only are to be forfeited.

But if the ship come from the East Indies, the captain is not liable to the effects of the above regulations.

The sail-cloth of North America is considerably improved, by moistening the warp in the loom with a decoction of gelatinous substance prepared from the refuse of neat's-feet, (after the oil is expressed,) which is boiled in water till it is converted into a kind of glue: the weavers of this article in Britain employ a paste made of flour and water, which necessarily renders the cloth brittle; whereas, by using the animal preparation above-mentioned, the sail-cloth will not only be rendered more durable, but the expense be lessened, and an article, that is at present thrown away, may be usefully employed.

SAIL-MAKING consists in the several principal processes of cutting out, seaming, and sewing on, the bolt ropes; all of which are again sub-divisible into an innumerable quantity of rules of art. In order to encourage the use and consumption of the manufacture of British sail-cloth, many statutes have been passed. These are 7 & 8 Wm. 3. c. 10. — 9 & 10 Wm. 3. c. 41. — 9 Geo. 2. c. 37. — 19 Geo. 2. c. 27. — 33 Geo. 3. c. 49. and 1 Geo. 4. c. 25. which repeals so much of 9 Geo. 2. c. 37. sect. 6, 7, as relates to the materials used in the manufacture of sail-cloth.

British sail-cloth may be exported duty-free, and all new ships are to have a suit of sails of British cloth.

Every maker of British sail-cloth shall stamp his name and place of abode, in words at length, on every piece, on pain of forfeiting 10*l.*

SAILORS AND MARINERS. See SEAMEN.

SAIL-YARD. See YARD.

SAL-AMMONIAC. (GER. *Salmiak*. DU. *Sal ammoniak*. DA. and SW. *Salmiak*. FR. *Sel ammoniac*. IT. *Sale ammoniaco*. SP. *Sal armoniaca*. PORT. *Sal ammoniaco*. RUS. *Naschatür*. POL. *Salmiak*, *Salmioniak*. LAT. *Sal ammoniacum*.) See AMMONIA.

SAL PRUNELLA. This name is given to a salt composed of nitric acid, and potash; it may be obtained from common nitre, by fusing it in a crucible, so as to deprive it of some of its water, and nitric acid.

It is sometimes employed as a cooling purgative medicine; but it is principally used in the salting animal provisions, to which it imparts a firmness, and bright-red colour.

SALE, is the transferring the property,

of goods, from one person to another, for certain considerations.

If a man agree for the purchase of goods, he shall pay for them before he carries them away, unless a term of credit be expressly allowed by the seller; or if the goods sold to be paid for on delivery at the purchaser's house, should, by any connivance or fraud, be detained without payment, the purchaser may be proceeded against as a swindler.

In all cases, it was advisable, when goods are sold for cash on delivery, to insert the words in the invoice, or bill of parcel.

If a man, upon the sale of goods, warrant them to be good, the law annexes to this warranty a tacit contract, that if they be not so, he shall make compensation to the purchaser; but the warranty must be upon the sale, and not after it.

If one take up goods of a tradesman, without an express agreement for the price, the real value of the goods must be paid.

If two persons come to a shop, and one buy, and the other to procure him credit, promise the seller, "*If he does not pay you, I will*" this is a collateral undertaking, and void, without writing, by the statute of frauds; but, if he says, "*Let him have the goods, I will be your paymaster*," this is an undertaking as for himself, and he shall be intended to be the real buyer.

By 29 C. 2. c. 5. Upon a contract for the sale of goods, of the price of 10*l.* and upwards, no action will lie, unless the buyer accept part of the goods sold, or give something in earnest to bind the bargain, or some note or memorandum, in writing, to be made and signed by the parties, to be charged with the contract, or their agents.

On sale of goods, if earnest be given to the seller, and part of them are taken away by the buyer, he must pay the residue of the money upon fetching away the rest, because another time is appointed; and the earnest given, binds the bargain, and gives the buyer a right to demand the goods; but a demand without paying the money is void. After earnest taken, the seller cannot dispose of the goods to another, unless there be some default in the bargain; therefore, if he do not take away the goods, and pay the money, the seller ought to require him so to do; and then, if he do not do it in convenient time, the bargain and sale are dissolved, and the seller may dispose of the goods to any other person. Earnest does not alter the property, but only binds the bargain, the property remaining in the vendor until payment of the money, or delivery of the goods.

If a man sell goods to be delivered at a certain day, and do not deliver them, an action may be brought against him, and damages recovered; so, if he deliver them in a bad and unmerchantable condition.

Where a person is entitled to a thing in gross, he is not obliged to accept it by parcels.

All sales and contracts of any thing vendible in fairs or market overt, shall not only be good between the parties, but also be binding on all those that have any right or property therein.

If goods are sold after a writ of execution delivered to the sheriff, the sale is considered as fraudulent, and the property of the goods is bound to answer the debt, from the time of the delivery of the writ. For foreign sales of merchandize. See ACCOUNT.

SALES BY AUCTION. A bidder at an auction, under the usual conditions, that the highest bidder shall be the purchaser, may retract his bidding any time before the hammer is down.

If the owners of any property put up for sale by auction employ puffers to bid for them without declaring it, and there is only one real bidder, who, by means of such puffers, is induced to purchase at a high price, such purchaser shall not be compelled to complete the contract.

If there be any concealment of the circumstances, which affects the title of any article purchased at an auction, and the vendee has paid the purchase-money, he may, nevertheless, waive the bargain, and recover back the money; but where the title is defective, the person who had become the purchaser can only recover back the deposit, with interest, and no further damages for the supposed loss of the bargain; but where the sale has not been completed, in consequence of misrepresentation of the title, the vendor will be liable to all expences incurred.

If a purchase be made at an auction, consisting of several lots, the seller must make a complete title to the whole, otherwise the bargain will be void.

No verbal declarations of the auctioneer, contrary to the printed conditions of sale, and catalogue, shall be admitted.

The auctioneer is a mere stakeholder to his principal, and is not to part with his deposit until the sale is finished; and it shall appear in whom the ultimate right is vested.

In case of non-performance of contract, and the auctioneer refuses to disclose his principal, an action should be brought against the auctioneer, otherwise against the principal.

The better opinion is, that goods sold at an auction are within the statute of frauds, and therefore a memorandum should be made and signed, &c. See FRAUDS.

But the auctioneer is agent for both parties, so as to comply with the statute by his signing. *Hinde v. Whitehouse*, 7 East, 558. *Senior v. Melivier*. *Wm. Black. Rep.* 599.

When a person advertises to sell to the best bidder, but with orders not to sell it under such a price, no action can be brought against the auctioneer for selling it under that price; but if such article had been sent with orders not to *put it up* under such a price, the auctioneer disobeying those instructions would have made himself responsible.

Where any deposit has been made, if the vendee refuses to complete the bargain, such deposit, and all claim to the thing intended to be purchased, will be forfeited.

An auctioneer who sells goods may maintain an action for them against the buyer, in his own name, although such goods were sold at the proprietor's own house. For auction-duties and exemptions of particular duties, see AUCTION.

SALES BY THE EAST-INDIA COMPANY. When goods are received in the private-trade warehouses, they are brought to sale with all possible dispatch. In these warehouses an even beam is never admitted; but in such cases, one pound weight is always added to the tare; and on all packages taring one quarter of a cwt. or upwards, one pound super tare is allowed.

In those goods which, for their better preservation, have an interior packing, as cassia lignea, cinnabar, aloes, &c. a proportionate allowance is always made.

Upon packages weighing one quarter of a cwt. gross, a two-ounce weight is placed in the scale by way of giving a turn in favour of the trade; one pound is also allowed for draught on goods of the above weight; and in case of an even beam, one pound is also deducted.

On all articles sold by the pound, there is a further allowance of tret, or four pounds for every 104, which consists chiefly in the following articles: viz. annatto, Carmenia-wool, cotton-wool, cotton-yarn, cardamoms, cloves, cubebs, cinnabar, cinnamon, indigo, mace, nutmegs, opium, quicksilver, rhubarb, senna, tortoise-shell, and white copper.

Weighable goods of a different description are sold by the cwt.

The following are the regulations in the Bengal Trade.

On all weighable goods, no weight is made use of less than a pound, a two-ounce weight excepted, which is always kept in the scale where the weight is placed.

On all weighable goods (raw silk excepted), one pound is allowed for draught on every package that weighs more than 28lbs. gross, and on every draught of goods, not in packages, exceeding 28lbs.

Weighable goods sold by the pound, except raw silk, have an allowance for tret, after the rate of four pounds for every 104.

Where some of the packages only of any parcel of goods are tared, if, on averaging the whole, there should be a fraction, it is made a pound by adding the fraction wanting.

On all weighable goods (tea and coffee excepted), one pound is allowed for super tare: on all packages that tare 28lbs. and upwards, and where the tare is taken on an average, and there should be a fraction, one pound and the fraction.

TEAS.

Quarter Chests.

If, on averaging those tared, they turn out even pounds, unless the chests weigh gross 84lbs. or upwards, no allowance is made; in which case, one pound super tare is allowed on each package.

Half Chests.

If, on averaging those tared, it turns out even, one pound only is allowed for super tare on each package; but where there is a fraction, one pound, and such fraction as above.

Whole Chests.

If the average of those tared should turn out even, two pounds are allowed on each package for super tare; but if there be a fraction, one pound, and the fraction as above.

Coffee.

If, on averaging the bales tared, it turns out even, two pounds are allowed on each for super tare; but if there is a fraction, two pounds and the fraction, as in the preceding articles.

The following Goods are sold by the East-India Company by the cwt.

Aloes	Hemp and Flax
Benjamin	Long Pepper
Borax	Mother-of-pearl Shells
Camphire	Munjeet
Cassia	Myrrh
China root	Olibanum
Cowries	Red-wood
Coffee	Rice
Cubebs	Saltpetre
Elephants' teeth	Sapan-wood
Fossil alkali	Sago
Galanga root	Sal-Ammoniac
Galls	Seedlac
Gamboge	Shellac
Ginger	Sticklac
Gum arabic	Turmeric
—tragacanth	Vegetable alkali
—unrated	Wax

Articles sold by the East-India Company, by the Pound.

Cardamoms	Mace
Carmenia-wool	Nutmegs
Cinnabar	Opium
Cinnamon	Pepper
Cloves	Quicksilver
Cotton-yarn	Raw-silk
—thread	Rhubarb
—wool	Tea
Indigo	

East-India Piece-Goods.

These consist of white calicoes; white, plain, checked, or flowered muslins, and white or yellow nankeen cloth: muslins, cossacs, and other sorts rated as muslins, receive 10l. per cent. drawback in full of every allowance.

Calicoes $\frac{3}{4}$ yard-wide, and up to 1 $\frac{1}{4}$, are entitled to 6d. per yard drawback, in manner following.

Each 10 yards is called a calico, and receives 5s. drawback.

Each ditto, from $1\frac{1}{2}$ yard-wide and upwards, upon each six yards (exclusive of $14\frac{1}{2}$ per cent. from the original price) 5s. ditto.

Diaper and dimity draws per yard, exclusive of 14 per cent. as above, 1s. 5d. ditto.

Broker's Charges.

Piece-goods, purchased of the East-India Company, $\frac{1}{4}$ to $\frac{1}{2}$ per cent. to be paid by the buyer.

Goods managed for proprietors in privileged private trade, &c. $\frac{1}{4}$ to $\frac{1}{2}$ per cent. to be paid by the employer.

For all piece-goods bought in other public sales, $\frac{1}{2}$ per cent. to be paid by the buyer.

Ditto by private contract, $\frac{1}{2}$ per cent. by the seller, unless otherwise agreed.

Valuation of piece-goods, $\frac{1}{4}$ per cent.

SALEP, the powder of the orchis roots. The farina of potatoes is said to be an excellent substitute for salep, and less liable to spoil by keeping. See STARCH.

SALESMAN, a dealer in ready-made clothes for men's wear.

SALESMASTER, one who sells sheep and black cattle at market for the graziers in the country, and has so much a score for selling them.

SALLAD-OIL, fine Italian or Florence oil. See OIL.

SALMON. (GER. *Lachs*, *Salm*. DU. *Salm*, *Zalm*. DA. and SW. *Lax*. FR. *Saumon*. IT. *Sermone*, *Salamonz*. SP. *Salmon*. PORT. *Salmão*. RUS. *Lemga*. POL. *Losos*. LAT. *Salmo*.) For particulars of catching this fish, &c. see FISHERY.

SALT, (GER. *Salz*. DU. *Zout*. DA. and SW. *Salt*. FR. *Sel*. IT. *Sale*. SP. and PORT. *Sal*. RUS. and POL. *Sol*. LAT. *Sal*.) a mineral body, readily soluble in water, not inflammable, and tasting sharp or pungent upon the tongue. Alum, nitre, the different kinds of alkali, &c. are all salts, but we limit ourselves here to treat of alimentary salt, or *muria*t of soda.

Alimentary salt is found under a variety of forms in its different states; but is immediately distinguished by applying it to the tongue; and always assumes a cubic, pyramidal, or parallelopiped figure, after regular crystallisation. It is sustained in vast quantities, in a liquid form, in sea-water, and in salt springs; and is also found solid in the bowels of the earth.

Sea-salt. — The preparation of this kind of salt depends upon a well-known fact, that the salt contained in sea-water, or brine-springs, being a fixed body, will not rise with the vapour of the water. All, therefore, that is wanted, is to expose the water containing salt to evaporation. The salt commonly known by the name of *bay-salt*, is obtained from the water of the sea by evaporation. It had this name from being first made in the bay of St. Ubes, in Portugal. This

evaporation is in some places performed by the heat of the sun, the water being let into shallow trenches, in order to expose as large a surface as possible. This method is practised in the southern provinces of France, and on a very large scale in Portugal. In the northern countries, where the heat of the sun is not sufficiently great, artificial fires are employed. In some salt-works these two methods are united; and in England, and countries where salt-rock is plentiful, that substance is dissolved in salt water, and then evaporated. In very cold countries another method is employed to separate the salt from sea-water. The water is exposed in trenches on the sea-shore, where it forms so thin a stratum, that the cold of the atmosphere acts powerfully in congealing it. As the frozen part consists of mere water, the fluid which remains is consequently more concentrated. The operation is then completed by means of artificial heat.

It is here to be observed that the sea-salt, which requires the heat of the sun to give it consistence, is that alone which, from its brown colour, is called *bay-salt*; for, that which receives its consistence from fire, is called *white-salt*. Low marshy grounds, disposed by nature for the reception of the sea-water, when the tide swells, and provided with banks and sluices to retain the same, are called salt-marshes. These salt-marshes, the bottoms whereof they ram with much care, are divided into several pits or basins, and into these basins, when the season is at hand, they let the sea-water. The salt season is from the middle of May to the end of August; in which time the days being long, and the rays of the sun strongest, the salt is raised and crystallised better than at any other period. The water is admitted to the height of about six inches, after first having let it rest, and warm, two or three days, in large reservoirs, without the works, that it may come in lukewarm. The water admitted, the sluices are closed, and the rest of the work left to the wind, and the sun. The surface of the water thickens at first imperceptibly, and becomes at length covered over with a slight crust, which hardening by the continuance of the heat, is wholly converted into salt. When its full crystallisation has been received, they break it with a pole, upon which it sinks to the bottom, whence being dragged out they leave it for some time, in little heaps, about the edge of the pit, to complete the drying; and at length in greater heaps, which they cover over with straw or rushes, to secure them from the rain. Eight, ten, or at most, fifteen days, having thus completed the process, they open the sluices, when the tide is rising, for a fresh stock of water, and continue thus to gather the salt till the season is over. Rainy weather is very pernicious to the work, for rain-water, mixing in any quantity with the sea-water, renders it use-

less. The salt is brown, green, or reddish, when taken out of the pits, on account of the mud-slime always mixed with it.

The chief coasts for bay-salt are those of Brittany, Saintonge, and the Pays d'Aunis, in France. Bay-salt is also made in Portugal, particularly at Setubal, or St. Ubes, the produce of which is reckoned so far preferable to all other kinds of bay-salt, for curing meat, that the Irish salters never fail to mix a considerable proportion of it with the other species of salt used by them in preserving the beef, pork, &c. destined for exportation. About four thousand tons of bay-salt are annually made at Porto Ferraio in Italy, and large quantities also at Trapani, in Sicily, and in various parts on the shores of the Mediterranean. They likewise prepare bay-salt in the Cape de Verd islands, particularly in the island of Tortuga, near the coast of Terra Firma, in America, which supplies the best part of North America.

White salt, as we have already observed, is produced by the action of fire. The most convenient works, for making white salt by boiling, are constructed in the following manner: The saltern, or boiling-house, is erected near the sea-shore, and is furnished with a furnace, and one or two large pans, which are commonly made of iron plates, joined together with nails, and the joints filled with a strong cement; and the bottom of the pans is prevented from bending down, by being supported by strong iron bars.

The salt-pan being filled with sea-water, a strong fire of pit-coal is lighted in the furnace; and then, for a pan which contains about 1400 gallons, the salt-boiler takes the whites of three eggs, and incorporates them all with two or three gallons of sea-water, which he pours into the salt-pan, while the water contained therein is only lukewarm, and mixes this with the rest by stirring it about with a rake. In many places they use, instead of eggs, the blood of sheep, or oxen, to clarify the sea-water: and in Scotland they do not give themselves the trouble to clarify it at all.

As the water heats, there arises a black frothy scum upon it, which is to be taken off with wooden skimmers. After this the water appears perfectly clear, and by boiling it briskly about four hours, a pan loaded in the common way, that is, about fifteen inches deep, will begin to form crystals upon its surface. The pan is then filled up a second time with fresh sea-water; and about the time when it is half filled, the scratch-pans are taken out and emptied of a white powder, seeming a kind of calcareous earth, which separates itself from the sea-water, during its boiling, before the salt begins to shoot. When these have been emptied, they are again put into their places, where they are afterwards filled again. This powder being violently agitated by the boiling

liquor, does not subside till it comes to the corners of the pan, where the motion of the mass is smaller, and it there falls into these pans placed on purpose to receive it.

The second filling of the pan is boiled down after clarifying in the same manner as the first, and so a third, and a fourth: but in the evaporation of the fourth, where the crystals begin to form themselves, they slacken the fire, and only keep the liquor simmering. In this heat they keep it all the while that the salt is granulating, which is nine, or ten, hours. The granules, or crystals, all fall to the bottom of the pan; and when the water is almost all evaporated, and the salt lies nearly dry at the bottom, they rake it all together into a long heap on one side of the pan, and then it is put into barrows, and carried to the storehouse, and delivered into the custody of his majesty's officers. In this manner the whole process is usually performed in 24 hours, the salt being commonly drawn out every morning. This is the method in most of our salt-works; but in some they fill the pan seven times before they boil up the salt, and so take it out but once in two days, or five times in a fortnight. In the common way of four boilings, from a pan of the usual size, containing 1400 gallons, they draw from fifteen to twenty bushels of salt every day, each bushel weighing fifty-six pounds.

When the salt is carried into the storehouse, it is put into brabs, which are partitions, like stalls for horses, lined at three sides and the bottom with boards, and having a sliding-board on the foreside to draw up on occasion. The bottoms are made shelving, being highest at the back, and gradually inclining forward; by these means the brine remaining among the salt, easily separates and runs from it, and the salt in three, or four, days becomes sufficiently dry; in some places they use cribs and barrows, which are long, and conic, wicker-baskets, for this purpose; and in some places wooden troughs, with holes in the bottom. The saline liquor which remains from the making of salt is what is called bittern, from which Epsom salt, or muriat of magnesia, is often extracted.

The white salt of Normandy is made by refining the bay-salt, but has this colour naturally, when taken out of the pits. To make it, they gather a muddy sand on the flats of the shore, which the rising tide has covered, and impregnated with its waters, for seven days. This sand being removed into pits for the purpose, discharges itself by degrees of all the water, which filtrates through some straw, wherewith the bottom of the pit is filled, and trickles into vessels set on purpose to receive it, and of this water they make the salt.

The English, and Dutch, and in time of war the Danes, and Swedes, take most of the salts of Brittany. That of Guerande is

preferred by the English, and Irish, to all the rest, as the best and whitest. That of Borneuf, though browner and heavier, is most used in France and the Baltic.

Salt obtained from springs.—This is obtained much in the same manner as the white salt of the sea-water. A great quantity of rock-salt is used at Northwich, in order to strengthen their brine-springs: and a much greater quantity is sent coastwise to Liverpool, and other places, where it is either used for strengthening brine-springs or sea-water. The advantage of strengthening weak brine or sea-water by means of rock-salt is very obvious. Suppose that the sea-water, at Liverpool, where large quantities of rock-salt are refined, would yield one ton of salt from forty-eight tons of water; then must a quantity of fuel sufficient to evaporate forty-seven tons of water be used, in order to obtain one ton of salt. But if as much rock-salt is put into the forty-eight tons of sea-water as can be dissolved in it, then will the sea-water resemble a brine fully saturated; each sixteen tons of which will give four tons of salt, and the whole quantity yielded by the evaporation of forty-seven tons of water will be twelve tons of salt.

What is called basket-salt, is the fine white salt obtained from our salt-springs. It is usually the weakest of all salts.

Rock-salt.—The fossile or rock-salt makes a considerable article of commerce. The mines near Wieliczka, in Poland, and those near Eperies, in Hungary, are particularly famous. Their depth and capacity are surprising, and within them exists a kind of subterraneous republic. The rocks of salt are hewn in form of great cylinders; the workmen using hammers, pickaxes, and chisels, as in stone-quarries, to separate the several banks of stone. As soon as the massive pieces are got out of the quarry, they break them into fragments, fit to be thrown into the mill, where they are ground and reduced to coarse flour, which answers all the purposes of sea-salt. The rock-salt exported from Liverpool constitutes a considerable branch of commerce, and goes principally to the Baltic.

Refined rock-salt is that obtained by dissolving the article in its crude state, in salt or fresh water, and afterwards boiling the solution, and pursuing the process described in another part of this paper.

The neighbourhood of Northwich, in Cheshire, is extremely abundant in rock-salt. The Northwich rock-salt is never used at our tables in its crude state; and its application to the pickling or curing of flesh or fish, or preserving any provisions, without its being previously refined into white salt, that is, without its being dissolved in water, and boiled down in what is called white salt, is prohibited under a penalty of 40s. for every pound of rock-salt so applied. The

pure, transparent masses, however, of rock-salt, might probably be used by us with our food, without any sort of danger or inconvenience; at least we know that rock-salt is so used, without being refined, both in Poland and Spain.

The quantity of rock-salt which may be dissolved in a definite quantity, suppose a pint of sixteen avoirdupois ounces of water, is differently estimated by different authors. It is not wholly improbable, that different sorts of rock-salt may differ somewhat with respect to their solubility in water.

The uses of salt.—Besides the ordinary domestic uses to which salt is applied, this mineral is extremely beneficial, as an article of food, to all graminivorous animals, especially sheep, which are uncommonly partial to it.

Hay, strongly impregnated with salt, is known now to be a complete preservative against the distemper called "the rot," in sheep. So ascertained is that fact, that by 58 Geo. 5. c. 77., the duties on rock-salt for the feeding of cattle, were diminished and regulated.

Salt was supposed by the ancients to be so detrimental to vegetation, that, when a field was condemned to sterility, it was customary to sow it with salt. Some modern agriculturists, however, consider it as a useful manure.

The only mines of rock-salt in England are those in the neighbourhood of Northwich, in Cheshire. These were discovered in 1670. The first stratum of salt occurs at the depth of about forty yards. The strata vary in thickness, are of a wavy structure, and alternate with strata of clay, under which they are found. The salt is in some places red, in others transparent. The ground over them consists of strata of red clay, coarse-grained sandstone, blue clay, sulphat of lime, and indurated clay. These mines are the most productive of any in the world. The salt is worked by running galleries into the strata, and leaving pillars of it to support the roof, symmetrically arranged, which gives the whole a beautiful appearance. It appears to be free from sulphat of lime.

The brine-springs of our country were known long before the rock-salt was found. When the miners, in searching for them, bore through the stratum of clay that lies over them, they spring up with great force.

At a place called Saltwater Haugh, near Butterfly, in the bishopric of Durham, and at Birtley, near the city of Durham, there is a multitude of salt-springs. Those of Butterfly rise in the river Weave, for the space of about forty yards in length, and ten in breadth; but particularly one, out of a rock, which is so strong, that in a hot summer, the surface will be covered with a pure white salt. Namptwich, on the river Weever, and Northwich, on the confluence of the Weever and Dan, in Cheshire, have very rich salt-

brines, the latter so much so, that they obtain six ounces of salt out of sixteen of water. That at Namptwich, according to the account of the people of the place, could be worked so as to yield a sufficiency of salt for the whole kingdom. In Lancashire, the spring at Barton is also very rich.

Respecting the most famous salt-mines and springs of other countries, we must refer the reader to books particularly dedicated to the subject of mineralogy; but we may, in general terms, observe here, that there are few countries in Europe without salt, and that it appears from all accounts, that the majority of brine springs, and mines of rock-salt, are found at the foot of high mountainous chains. The mines of Transylvania, Upper Hungary, Moldavia, and Poland, are proofs of this general principle. These mines, which are very numerous, and important with regard to their extent, the vast bodies of salt they contain, and their product, are found along the chain of the Carpathian mountains, and spread nearly in an equal degree on each side of the chain. They accompany these mountains to the extent of more than two hundred leagues, from Wieliczka in Poland, toward the north, to Fokszian, or Rymnick, in Moldavia, to the south.

The stripe of land that contains the salt-mines or brine-springs is near forty leagues broad in some parts. In it may be reckoned about sixteen mines, that are worked for salt; forty-three indications of mines, that have never been wrought; and four hundred and twenty, or four hundred and thirty brine-springs.

The Transylvanians and Moldavians extract salt from their brine-springs, by throwing the water on wood-fires, as the Gauls and Germans did in former days.

No salt-mine or brine-spring is known either in Sweden, or in Norway. But there are a great number of both, and particularly of salt lakes, in Russia. The latter is peculiar to this country, there being no salt lakes in any other part of Europe.

Among these is the salt lake of Tor, towards the northern extremity of Little Tartary.

There are similar salt lakes in the Crimea, which appear to belong to the same system; and at Balachna, on the banks of the Wolga, are some very rich brine-springs.

In Russia in Asia too we find brine-springs, of which there are a great number, at the foot of the mountains of Poyas.

In the government of Astrachan to the north of the Caspian sea, in the environs of Orenburg, and in the country of the Bashkirians, salt lakes are very common; and the water evaporating during the summer, the salt appears crystallised on their surface, and round their borders. When this water is highly concentrated, it has a deep red colour. The salt formed in them has often

the same hue; and when this is the case it diffuses a very perceptible violet smell.

Near Astrachan too is the mine of Iletzki, celebrated for the quantity of salt it furnishes.

In Siberia there is a mine of rock-salt, on the right bank of the Kaptendoi; and on that of the Kawda are fourteen brine-springs. Others are found in the government of Kolivan, in the centre of Asiatic Russia. Lastly, the country near the Caspian sea is so impregnated with muriat of soda, that in the environs of Gourief, the fogs and dew that settle on people's clothes, and on plants, are saline.

Among the Mungal Tartars the soil is so thoroughly penetrated with muriat of soda, that the people lixiviate it, and evaporate the solution, to obtain the salt.

That part of China which borders on Tartary contains salt-mines, and the ground is strongly impregnated with salt.

Salt is found in the same manner throughout almost the whole table-land of Great Tartary, Tibet, Indostan, and particularly Persia, where very extensive plains are seen covered with saline efflorescences. This is evidently the case near Bender-Congo.

The isle of Ormus, at the mouth of the Persian Gulf, appears to be one large rock of salt.

This substance is likewise found in solid masses near Balach on the eastern frontier of Persia; in the environs of Ispahan, in Media; in the mountains that surround Komm, to the north of Ispahan, &c.

The salt-mines of AMERICA are less known, but they appear to be numerous in that quarter of the globe, and to exist under the same circumstances as in the old continent.

There are salt-mines or brine-springs in Kentucky, the western part of the United States, behind the Alleghany mountains.

In California salt is found in a very pure state, and in large solid masses.

The mountain of Xaragua in the island of Hispaniola, or Hayti, affords salt; and in the same island there is a very remarkable salt lake about twenty-two leagues in circumference, called Henriquelle.

Salt lakes occur in others of the West India islands.

In Peru there are several mines of salt gem in very hard masses. What is remarkable in their position is, that they are in the highest part of the country, as, for instance, in Potosi. The most usual colour of the salt is a jasper-violet.

There are likewise salt plains in South America. One of great extent is mentioned in the environs of Lepis, toward the northern extremity of Peru. Another in Chili, in the provinces which are nearest to Peru. And, lastly, in the southern extremity of America, near St. Julian's Bay, in Patagonia, there is a salt-marsh two miles long.

Salt of every description in these kingdoms,

is subject, in some shape or other, to the laws of customs or excise. The statutes are so voluminous, and their regulations so diversified and minute, that we can only refer the reader to those of them necessary for general information. 13 & 15 Car. 2. 26 Geo. 2. c. 3. 38 Geo. 3. c. 89. 45 Geo. 3. c. 14. 49 Geo. 3. c. 81. 51 Geo. 3. c. 82. and 57 Geo. 3. c. 49.

By the last-mentioned statute every dealer in, retailer, or seller of salt, shall make entry at the nearest office of excise of his warehouse, storehouse, cellar, shop, or other place, in which he shall keep such salt, and shall upon demand receive from the proper officer a book to be prepared with proper printed forms and titles for the purposes hereinafter mentioned, and kept by every such dealer in, retailer, and seller of salt, in some open part of his entered premises; and after the 10th of October, 1817, no salt exceeding two bushels at one time shall be sold, sent out, or delivered, by any such dealer in, retailer, or seller of salt, to any person, without a certificate filled up and cut out progressively from the printed forms of such certificates contained in such book, signed by such dealer in, retailer, or seller of salt, or some person on his behalf, certifying the date, quantity, to whom sold, from whose stock delivered, and that the duty has been paid or secured to be paid, &c. &c.; and salt otherwise removed, &c. shall be forfeited, and all persons concerned in the removing shall be liable to a penalty of 50*l*.

By the same statute a provision is made for the delivery of coarse rock-salt for the purpose of feeding cattle at a diminished rate of duty, but by 58 Geo. 3. c. 77., these provisions are repealed, and others substituted, but with the same general views. See 59 Geo. 3. c. 57. and 3 Geo. 4. c. 82. which very greatly reduces the salt duties.

SALT, Epsom, the sulphat of magnesia. It is of an intensely bitter taste. Its crystals are tetrahedral prisms, with obliquely truncated ends. That usually sold in the shops is in minute crystals of a snowy appearance; and it is with a view to imitate this form, that the manufacturers of sulphat of soda endeavour to give this last salt the same appearance, in order that they may dispose of it under the name of Epsom salt. It is, however, easy to distinguish it from the genuine sulphat of magnesia, since it effloresces on exposure to a dry atmosphere, and does not yield magnesia.

There is also substituted in the shops for Epsom salt, a mixture of these two sulphats with several earthy muriats procured from the mother-waters of the salt-springs of Lorraine, and Franche Comté, and from the salt-marshes in the south of France.

Few waters contain sulphat of magnesia, but some mineral springs furnish it in such abundance as amply to compensate the

trouble and expense of procuring it. It is particularly obtained, in a very pure state, from those of Epsom, Egra, Sedlitz, and Seydchütz: sea-water, and that of salt-pits, yield it in a greater or less quantity, but always mixed with sulphat of soda. *Chaptal*.

SALT, Glauber's. See **GLAUBER'S SALT**.

SALT, Rochelle. See **ROCHELLE SALT**.

SALT-CELLAR, a small stand or vessel for holding the salt which we use at meals. Salt-cellars are of different figures and sizes, according to the fancy of the workman, and are formed of various substances, such as gold, silver, pewter, glass, &c. The salt-cellars made of glass are those most used at present, and the pitch of perfection to which our glass-cutters have carried articles of this description, is truly surprising. London is the chief seat of this elegant branch of the glass-trade. Salt-cellars, if elegantly cut, meet with a rapid sale both in Ireland, and on the continent of Europe.

SALTPETRE, (*GER. DU. DA. and SW. Salpeter. FR. Nitre, Salpêtre. IT. Nitro, Salnitro. SP. and PORT. Nitro, Salitre. RUS. Senitra. POL. Saletro, Salnitra. LAT. Nitrum,*) or *nitrat of potass*, called also saltpetre. Roger Bacon mentions this salt so long back as the 13th century under the name of *nitre*. It is found abundantly on the surface of the earth in India, South America, and even in some parts of Spain. In Germany, and France, it is obtained by means of artificial nitre-beds. These consist of the refuse of animal, and vegetable, bodies undergoing putrefaction, mixed with calcareous and other earths.

At Padolia, in Poland, saltpetre is obtained from tumuli, or hillocks, which are the remains of former habitations. In America it has been found in limestone grounds, in the floors of pigeon-houses, tobacco-houses, or the ruins of old stables. In Hanover it is got by collecting the rakings of the streets, which are built of mud-walls; and the peasants are directed by law to build mud-walls with the dung and urine of animals, and some straw. After they have stood for some time, and the vegetable and animal substances are rotten, they afford a considerable quantity of nitre. With respect to Indian saltpetre, the general account is, that it is obtained from the soil of certain districts in the East Indies, which are called saltpetre-grounds, where the soil is very cold, barren, and unhealthy. To extract the salt, it is there only necessary to gather large quantities of the impregnated earth, and to put them into a cavity, through which a great quantity of water is poured, which dissolves the nitre; and the lixivium runs into an adjacent pit, out of which it is lifted in order to be evaporated, and obtained

in the form of crystals. In Germany and France it is not unusual with the saltpetre boilers to go about in search of the materials just mentioned; and when, on making a small essay, they find that they will turn to account, they put the earth into a large tub, pour water on it, and let it stand so for several days. A cock is placed at the bottom of the tub, and to its inside opening some straw is applied, so that when the cock is opened, the lixivium filters through the straw, and is received into another tub, and thence conveyed to a copper, wherein it is boiled to a proper consistence for crystallisation: the crystals are at first brown, and very impure, but by repeated dissolution and crystallisation, become white and pure.

It has been ascertained that if oxygen gas be presented to azote at the instant of its disengagement, nitric acid is formed. This seems to explain the origin of the acid in the nitre beds. The azote disengaged from these putrefying animal substances combines with the oxygen of the air. The potass is furnished, or partly at least, by the vegetables and the soil.

Saltpetre is of very extensive use in different arts, being the principal ingredient in gunpowder, and serving as an excellent flux to other matters; whence its use in glass-making. It is also possessed of considerable antiseptic power, whence its use in preserving meat, to which it communicates a red colour. In medicine it is employed as a diuretic, sedative, and cooler. Nitre is also used in the oil-of-vitriol manufactories.

SALTWÖRT, or GLASSWÖRT, *Salsola*, L. a genus of plants, of which two species, being indigenous, are used for making the salt, known under the name of *kali*, considerable quantities of which are employed in the manufacture of glass. The process is as follows: a trench being dug near the sea, laths are placed across it, on which the herb is laid in heaps; a fire is then kindled below, and the liquor extracted from the plants drops to the bottom, where it ultimately acquires a thick consistence, when it becomes *kali*, which is partly of a black, and partly of an ash-colour, very sharp and corrosive, being of a strong saline taste; when thoroughly hardened, it resembles solid stone, and in that state is fit for use.

SALVAGE. Salvage is an allowance made for saving a ship, or goods, or both, from the dangers of the seas, fire, pirates, or enemies. What that allowance is, may be collected from a review of the following acts of parliament.

It appears from the act of 12 Anne, st. 2. c. 18, that if a ship was in danger of being stranded, or being run ashore, the sheriffs, justices, mayors, constables, or officers of the customs, nearest the place of danger, should, upon application made to them, summon and call together as many men as should be thought necessary to the assistance, and for

the preservation, of such ship in distress, and her cargo; and that if any ship, man of war, or merchantman, should be riding at anchor near the place of danger, the constables and officers of the customs might demand, of the superior officers of such ship, the assistance of his boats, and such hands as could be spared: and that, if the superior officer should refuse to grant such assistance, he should forfeit 100*l*.

But the master of a stranded vessel having, by recommendation of the pilot, sent to defendant on shore (a stranger) to send him assistance, which he did; and under his direction, but also under the inspection of custom-house officers attending, the goods were brought on shore, and housed, under the joint locks of himself and collector of customs, and he paid all the salvors: Held that this constituted him agent of the owners, and took the case out of the statute, which orders the quantum of salvage to be by the award of justices; for the statute only applies to cases where application is made by owners to certain officers. *Baring v. Day*, 8 E. R. 57.

Subsequent to this, other statutes were passed on the same subject, but the whole of their provisions are comprised in an amended form in stat. 49 Geo. 3. c. 122. altered by one of 53 Geo. 3. c. 87. By the authority of these, pilots and others taking possession of wrecked materials, shall send notice thereof to a deputy vice-admiral, within 48 hours, on pain of being considered as receivers of stolen goods. The salvage to be determined by two justices, with, or without, an umpire (according to circumstances,) as well as rewards for saving the lives of passengers, and paid out of the proceeds; and persons plundering wrecks, and not complying with the directions of the statute, to be guilty of a misdemeanor, and be subject to transportation for seven years. Perishable goods may be ordered to be sold by the justices; the proceeds to be placed in certain hands for a time, to answer the claims of all persons entitled.

Questions of salvage of wrecks *between high and low water mark*, reserved for determination in courts of Admiralty and of Westminster-hall; and all penalties and forfeitures above 20*l*. to be recovered also in the superior courts.

Beside these general statutes, the 48 Geo. 3. c. 130. was passed for the particular protection of wrecks, and the adjustment of salvage in the cinque ports.

These are regulations for salvage in case of wreck.

The salvage payable upon recapture, has, from time to time, been also regulated by acts of parliament. By 53 Geo. 3. c. 66. s. 42. it is enacted, that, "if any ship, vessel, or boat, taken as prize, or any goods therein, shall appear and be proved, in the court of Admiralty, to have belonged to any of his majesty's subjects of Great Britain, or Ire-

and, or any of the dominions and territories continuing under his majesty's protection and obedience, which were before taken by any of his majesty's enemies, and, at any time afterwards, retaken by any of his majesty's ships of war, or any private man of war, or other ship, vessel, or boat, under his majesty's protection or obedience, that then such ships, vessels, boats, and goods, and every such part and parts thereof as aforesaid, belonging to such his majesty's subjects, shall be adjudged to be restored, and shall be, by decree of the said court of Admiralty, accordingly restored to such former owner, or proprietor, or proprietors, he or they paying, for and in lieu of salvage, if retaken by any of his majesty's ships of war, *an eighth part of the true value of the ships, vessels, boats, and goods, respectively so to be restored*; which salvage shall be answered and paid to the captains, officers, and seamen, in the said men of war, to be divided as before in this act is directed: and, if retaken by any privateer, or other ship, vessel, or boat, *one-sixth part of the true value of the said ships, vessels, boats, and goods*; all which payments, to be made to any privateer, or other ship, vessel, or boat, shall be without any deductions. And, in case of recapture by the joint operations of any of his majesty's ships, and any private ship of war, then the judge of the court of Admiralty shall order such salvage to be paid to the recaptors, as he shall deem fit and reasonable, which salvage shall be paid to the agents of the recaptors, in such proportions as the said court shall adjudge. But if such ship, so retaken, shall appear to have been, after the taking by the enemy, by them set forth as a vessel of war, the same shall *not* be restored to the former owners, but shall be adjudged lawful prize for the benefit of the captors."

The wearing-apparel of the master and seamen are always excepted from the allowance of salvage. — *Lex Mercatoria*, 147.

The valuation of a ship, in order to ascertain the rate of salvage, may be determined by the policy of assurance, if there is no reason to suspect she is undervalued: and the same rule may be observed as to goods, where there are policies upon them. If that, however, should not be the case, the salvors may insist upon proof of the *real* value, which may be done by the merchant's invoices, and they must be paid for accordingly. — *Lex Mercatoria*, 147.

The assured may recover from the assurer the expenses of salvage; yet he cannot receive a double satisfaction for the same loss. Thus, if the assurer should have paid to the assured the expenses arising from salvage, and afterwards, on account of some particular circumstance, the loss should be repaired by some unexpected means, the assurer shall stand in the place of the assured, and receive the sum thus paid to atone for the loss. — *Randall v. Cockran*, 1 Ves. 98.

Cases frequently arise, in which the salvage is so high, the other expenses so great, and the object of the voyage so far defeated, that the assured is allowed to *abandon* his interest in the property saved to the assurer, and to call upon him to contribute, as if a total loss had actually happened. See ABANDONMENT.

By 29 Geo. 2. c. 34. the right of the original owner of ship, &c. in case of recapture, is preserved to him for ever, upon payment of certain salvage, from one-eighth to half the value.

No passenger is entitled to make any claim for the ordinary assistance he may be enabled to afford to the vessel in distress; it being the duty, as well as the interest, of all persons on board, to contribute their aid on such an occasion.

But in the case of a ship bound to the West Indies, which struck upon the shoals off Chichester, in a gale of wind, and in that situation was deserted by the master, who took part of the crew with him, the plaintiff, who had commanded vessels in the same trade, and was then on board, *as a passenger*, took the command by the desire of his fellow-passengers, and with the consent of the mate, and the remainder of the crew, and carried the ship back in safety to Ramsgate harbour. The jury gave 400*l.* by their verdict to the plaintiff, and on application for a new trial, the court of common pleas refused to grant it. — *Newman v. Walters*, 3 B. & P. 612.

SAMIAN EARTH, *terra Samia*, a medicinal earth, or bole, found in the island whence it has its name, among beds of stone, not properly in the fissures of strata, for the stones it lies among do not form any; they are a kind of large and flat fragments of a soft stone, of a pale brown colour, and there are several ranges of them, between which this earth lies, in a kind of discontinuous horizontal stratum. This earth stands recommended as an excellent astringent, but it is so much inferior to any of the Oriental, and even to some of the European boles, that it would be idle to attempt the bringing it into use.

SAMPLE, a small quantity of an article exhibited at a public, or private, sale, as a specimen of the commodity. Sugars, wool, spirits, wine, coffee, and nearly every species of merchandise, is sold by sample. If an article is not, on an average, equal at least to the sample whereby it is sold, the buyer may recall his contract, and return the article upon the hands of the seller.

SAND is distinguishable into various species, by their different colours.

Sand is of great use in the glass manufacture; the white being employed for making of the white glass, and a coarse grey sand for the green glass.

In agriculture, it seems to be the office of sand to make unctuous earths fertile, and fit

to support vegetables, &c. For earth alone, we find, is liable to coalesce, and gather into a hard coherent mass. Common sand is, therefore, a very good addition, by way of manure, to all sorts of clay-lands; it warms them, and makes them more open and loose. The best sand for the farmer's use, is that which is washed by rains from roads or hills, or that which is taken from the beds of rivers; the common sand that is dug in pits never answers so well. However, if mixed with dung, it is much better than laid on alone; and a very fine manure is made by covering the bottom of sheep-folds with several loads of sand every week, which are to be taken away, and laid on cold stiff sands, impregnated as they are with the dung and urine of the sheep.

The sea-sand is much used as manure in different parts of the kingdom. It has also been tried in hot-houses, to supersede the use of bark, but with very indifferent success.

SANDAL. See SANDERS.

SANDARACH. See GUM SANDARACH.

SANDERS, or SAUNDERS, (GER. *Sandelholz*. DU. *Sandelhout*. DA. *Sandelholt*. SW. *Sandel*. FR. *Santal*, *Sandal*. IT. *Sr.* and *Port*. *Sandalo*. RUS. *Sandal*. POL. *Cyndal*, *Sandal*. LAT. *Santalum*.) a hard odoriferous wood, the produce of the *pterocarpus santalinus*, brought from the East Indies. Of this there are three sorts; the yellow, white, and red.

The yellow, or citrine sanders, is a beautiful wood, of the colour of lemon-peel, of a smell approaching to a mixture of musk and roses, and of a somewhat acrid taste, with a slight bitterness.

The white resembles the yellow, and is of the same fragrant smell, and aromatic taste, but in a slighter degree. Both these sorts should be chosen in the block, (that is, not separated into chips, as they usually are,) sound, firm, heavy, and of a good smell when cut.

The red is of a dense and compact texture, remarkably heavy, and very hard. It is brought to us in logs of considerable length, the surface of which is of a dusky, and the inside of a blood-red. It has but little smell, or taste.

Brazil-wood is frequently sold for red-sanders; but the latter may be distinguished from the former, by its not giving any tinge to aqueous liquors, whereas Brazil-wood imparts its colour to water.

These three kinds of wood enter into the materia medica; they are also used by the turners, and cabinet-makers, and the red by the dyers.

SANDIVER, or GLASS-GALL, (GER. *Glasgalle*. DU. *Glasgal*. DA. *Glasgælde*. SW. *Glasgalle*. FR. *Fiel de verre*. IT. *Fiele de vitro*. SP. *Fiel de Sal de vidrio*. PORT. *Fel de vidro*. LAT. *Fel s. Sal vitri*.) is a saline matter, which rises as a scum in the pots or crucibles in which glass is made.

This matter is chiefly composed of sulphat of soda, common salt, sulphat of potash, or other neutral salts, which cannot enter into vitrification, and which were originally contained in the ashes or alkalis employed in the composition of glass. Glass-gall is used to facilitate the fusion of certain ores, and in essays; but this matter must vary much, according to the kinds of alkali, or ashes, from which it is produced.

SAND-STONE, a genus of fossils found in various parts of Britain.

Sand-stones are of great utility for buildings designed to resist the combined effects of air, fire, and water; some of these fossils are soft while in the quarry, but become hard on being exposed to the air. Those of a friable nature are generally employed, being best adapted to this purpose, because the hard kinds are apt to burst in the fire; the latter, however, will admit of being polished, and may be advantageously used for whet-stones,

SANGUINING, is the art of imparting a bluish, purplish, or reddish hue, to the steel-blades of swords, &c. The following receipt will serve to convey a just idea of the nature of this process. Take your iron, and after you have well polished it, and heated it a little, rub it over with some dragon's blood purified, and it will be of a fine transparent reddish colour. A blue colour may be brought upon iron or steel burnished, by laying it upon a clear charcoal fire, blowing lightly, until you perceive the blue colour upon your iron, and then taking it out in a little time; or, by heating your iron or steel first, and rubbing it over with a woollen cloth, dipt in indigo ground, and tempered with salad oil. This blue is fitter for large work, as muskets, pistols, &c. and the former for swords, daggers, scimitars, and other small work. If you would have it a black colour, first clean and polish it, then rub it over with a piece of woollen, dipped in a little salad oil.

The following mode of making blue letters on sword-blades may be, not improperly, introduced under this head.

Take the blade, hold it over a charcoal fire till it is blue; then, with oil colours, write what letters you will upon the blade, and let them dry; when dry, take good strong vinegar, make it warm, and pour it all over the blade; this will take off the blue colour; then wet your oil colour with fresh water, and it will come off easily, and the letters drawn therewith remain blue.

SANGUINE-STONE, *lapis sanguinalis*, a kind of jasper brought from Spain, of a dark brown colour, marked with blood-red spots.

SAPAN, (GER. *Sapanholz*, *Japanholz*. DU. *Sapanhout*. DA. *Sapanholt*. SW. *Sapan*. FR. *Bois de Sapan*. IT. *Legno di Sapan*. SP. and PORT. *Sapan*. LAT. *Lig-*

num Sappan.) a species of wood, similar in every respect to the Brazil-wood, and employed for the same purposes. The tree, which produces it, is found in South America, Japan, and Cochin-china. The Sapan, and the cypress-tree, are more commonly met with in Japan than any others, and are employed not only in the construction of edifices and ships, but in the formation of cabinets, chests, boxes, &c.

SAP-COLOURS, are of that nature, that they are capable of being entirely dissolved in water, but are by no means miscible with oils. They are transparent, and of a viscid nature; whence they stand in no need of any cementing substance, neither do they dry easily, for the same reason. All colouring juices and extracts inspissated by evaporation may be used with this intention: as for instance, a decoction of Brazil-wood prepared with alum, and inspissated, extract of saffron, refined Brunswick green, crystallized verdigris, an aqueous extract of litmus, with the addition of a little alkali, gamoge, sap-green, and the inspissated decoction of the green husks of walnuts. Of these, sap-green is prepared from the expressed juice of buckthorn-berries not perfectly ripe, (*Rhamnus catharticus*, Lin.) reduced by gentle evaporation to the consistence of honey. The sap must be well clarified before it is evaporated. When it is inspissated, as much alum, or, which is still better, sugar of lead, is to be mixed with it by little and little over the fire, as is requisite to produce the finest green colour. A redundancy of these additions is prejudicial. The complete exsiccation must be made with a gentle heat in saucers.

Ferber gives the following description of it: *Archil* (*Lichen rocella*) is to be mixed with urine, lime water, slaked lime, and some pot-ash, in several large cisterns, which must be kept under shelter, and suffered to stand for several weeks. By these means the mass is rendered soft, and passes over to a kind of fermentation or evolution of its particles, and of the colouring matter contained in them. Now and then it is stirred, and suffered to stand macerating, till the mass is become quite blue, and is converted into a muddy kind of pulp. Upon this the whole mixture is ground in a mill constructed for the purpose, and the pulpy magma dried in moulds. Hither also may be referred the fine sap-blue discovered by Struve.

In order to make this, a quarter of an oz. of indigo is to be reduced to powder, and triturated in a glass-mortar with two ounces of good oil of vitriol. After this, 4 oz. of alum are to be dissolved in warm water, to which must be added 2 oz. of a solution of tartar in water, or as much as is requisite for completing the precipitation. The precipitate is then to be edulcorated and filtered; and when it is almost dry, the above-mentioned solution of indigo is to be mixed with

it. In this manner is obtained a fine blue colour, void of all acrimony, which may be mixed with water *ad libitum*; with which silk, leather, and bones, may be tinged of different shades; and which, with some gum, forms also a fine sap-colour.

SAP-GREEN. (GER. *Softgrün*. DU. *Sapgroen*. DA. and SW. *Softgrün*. FR. *Verde de vessie*. IT. *Verde vescica*. SP. *Verde vejiga*. PORT. *Verde-bexiga*.) See **SAP-COLOURS**.

SAPPHIRE, (GER. *Sapphir*. DU. *Saffiersteen*. DA. SW. and FR. *Saphir*. IT. *Zaffiro*. SP. *Safiro*, *Safir*. PORT. *Safira*. RUS. *Jachant*. POL. *Szafir*. LAT. *Sapphirus*.) a genus of precious stones, of a blue colour, and the hardest of all, except the ruby and diamond. They are found in the same countries with the ruby; also in Bohemia, Alsace, Siberia, and Auvergne.

The blue fluor spars are frequently met with in collections under the name of sapphires; and it is certain from Pliny, b. 37. chap. 9., that the sapphire of the ancients was our lapis lazuli. They are seldom found of a deep-blue colour throughout, or free from parallel veins; and when they are but slightly tinged, they are named white sapphires. Some are found half green and half red, and are foliated like the ruby. The fine hard sapphires, called by the jewellers oriental, are of the same nature with the ruby and topaz, excepting the mere circumstance of colour. They are commonly in two oblong hexagon pyramids, joined at their base, and pointed at top; sometimes also in hexagonal columns. When powdered, these precious stones are fusible with borax or microcosmic salt, into a transparent glass; and the same thing happens on treating them with *magnesia alba*. They are said to lose their colour by fire, and to become so hard and transparent as sometimes to pass for diamonds; but this is not well ascertained of the genuine sapphire.

SARCENET, a kind of fine, thin woven, plain silk, usually employed in making the gowns, &c. of females.

SARCOCOLLA. See **GUM SARCOCOLLA**.

SARDINES, or **SARDINIAS**, (GER. *Sardellen*. DU. *Sardynen*. DA. and SW. *Sardeller*. FR. *Sardines*. IT. *Sardine*. SP. *Sardinas*. PORT. *Sardinhas*. RUS. *Sardeli*. POL. *Sardely*. LAT. *Sardinæ*.) a species of fish of the herring tribe. These fish are round, scaly, and finned; the back is furnished with a softish fin, extending near half the length of the fish; under the belly, behind the anus, is another fin proceeding nearly to the commencement of the tail-fin; behind the gills are two smaller fins, and two more under the belly, formed rough, or denticulated, like those of the herring and the shad-fish. The largest sardines do not exceed, in size, herrings of middling dimensions. Like the herring, the sardine is

a fish of passage, appearing upon the French coasts, at certain seasons, in shoals; but it is never found, like the shad-fish, in any of the rivers. They are met with both in the Ocean, and Mediterranean, especially in the latter, in great abundance.

Sardines are taken in considerable quantities on our coasts, and are exceedingly plentiful on the coasts of Algarva in Portugal, Cadiz, and Grenada, in Spain, and along all the shores of Italy. The small sardines, caught on the coast of Provence, in France, are esteemed by epicures as being superior to all others of this species. From a thousand, to twelve hundred, fishing-smacks are engaged in catching these fish on the coast of Brittany, from the month of June to the middle of October. The French frequently cure their sardines in red brine, and when thus prepared, designate them *anchoisès*, or *anchovied sardines*. These they pack in vessels previously employed for holding wine, and export them to the Levant, where they are re-packed in small casks, and sent to Bukharia. When perfectly fresh, sardines are accounted excellent fish, but if kept for any time, they entirely lose their flavour, and become quite insipid. Fresh sardines are conveyed on horseback, from the ports of France to the inland cities and towns of that country. Abundance of this fish is salted and pickled in several ports of England and France, Italy, Sardinia, Portugal, and Spain, and thence exported to different parts of the world.

SARDONYX, a precious stone, consisting of a mixture of the chalcedony, and cornelian, it is sometimes in strata, but at other times blended together. Two kinds are generally distinguished. 1. Striped with white and red strata, which may be cut in cameo as well as the onyx. 2. White with red dendritical figures, greatly resembling the mocha-stone; but with this difference, that the figures in the sardonyx are of a red colour, in the other black. There is no real difference, excepting in the circumstance of hardness, between the onyx, cornelian, chalcedony, sardonyx, and agate, notwithstanding the different names bestowed upon them.

SARPLAR, of *Wool*, otherwise called a packet, is half a sack; a sack eighty tod; a tod two stone; and a stone fourteen pounds. In Scotland it is termed *sarpliath*, and contains eighty stone.

SARSAPARILLA, (GER. *Sarsaparille*. DU. *Sarsaparille*. DA. *Sarsaparille*. SW. *Sarsaparilla*. FR. *Salsepareille*. IT. *Salsapariglia*. SP. *Zarsaparilla*. PORT. *Salsa parilha*. LAT. *Sarsaparilla*.) the root of the *smilax sarsaparilla*, a plant growing in America, and particularly, abundantly, in Jamaica, whence we receive it.

The flower is yellow, mixed with red. The fruit is a black berry, containing several brown seeds.

Sarsaparilla delights in low moist grounds,

and near the banks of rivers. The roots run superficially under the surface of the ground. The gatherers have only to loosen the soil a little, and to draw out the long fibres with a wooden hook. In this manner they proceed till the whole root is got out. It is then cleared of the mud, dried, and made into bundles.

The sensible qualities of sarsaparilla are mucilaginous, and farinaceous, with a slight degree of acrimony.

The china, or oriental species of China root, has roundish, prickly stalks, and red berries, and is a native of China and Japan. The pseudo-china, or occidental species, has rounder smooth stalks and black berries, grows wild in Jamaica, and Virginia, and bears the colds of our own climate. At present the China root is very rarely made use of, having for some time given place to sarsaparilla, which is supposed to be more effectual.

Sarsaparilla is a sudorific, and an attenuant, and was much esteemed in the cure of the venereal disease, till the use of mercury caused it to be neglected.

SASSAFRAS. (GER. DU. DA. SW. and FR. *Sassafras*. IT. *Sassafrasso*. SP. *Sasafras*. PORT. *Sassafras*. RUS. *Sassafras*. POL. *Sassafras*. LAT. *Sassafras*.) The *laurus Sassafras*, or sassafras-tree, is a native of North America, and grows in the greatest perfection in Florida. Its roots are even with the surface of the ground. Its trunk, which is very straight, without leaves, and not high, is covered with a thick and dirty bark, of an ash-colour, and throws out at its summit some branches, which spread out on every side. The leaves are disposed alternately, green on the upper, and white on the under surface, sometimes divided into three lobes, sometimes entire of different sizes, from three to six inches long, and nearly as broad, with clusters of small yellowish flowers, succeeded by small blackish pendent berries, fixed to a red pedicle, and to a calyx of the same colour.

The root of the sassafras has a fragrant smell, and a sweetish, aromatic subacid taste; the bark tastes much stronger than any other part, and the small twigs stronger than the large pieces. It is a warm aperient and corroborant, and frequently employed with good success for purifying the blood and the juices. For these purposes decoctions are made from the rasped root, or bark. In America the bark of this tree is used for dyeing worsted a fine-lasting orange-colour; some people also boil the peel of the root with beer during the process of brewing, because they believe it to be wholesome. The flowers are used instead of tea.

An oil extracted from sassafras-wood is very fragrant, and possesses most of the virtues of the wood itself.

SAT, a measure used at Siam, for corn,

seeds, pulse, and some dry fruits; it is a sort of bachel made of bamboo, and forty of the sats make a seste; and forty sestest the cohi. It is hard to reduce this measure to the European standard; it is, however, generally accounted about 500 lbs. marc.

SATALEER, a silver coin, current in the East Indies, at about 7½d. sterling.

SATIN, (GER. *Atlas*. DU. *Atlas*. DA. *Atlas*, *Atlask*. SW. *Atlask*. FR. *Satin*. IT. *Raso*. SP. *Raso liso*. PORT. *Selim*. RUS. *Atlas*. POL. *Atlas*;) a soft, closely woven silk, with a glossy surface, usually employed for women's wear. In the manufacture of other silken stuffs, such, for example, as taffety, the mode is to raise alternately each half of the warp, in order to form the body of the stuff. On the contrary, in weaving satin, the workman only raises the fifth or the eighth part of the warp; by these means the woof is hidden beneath the warp, which, presenting an even, close, and smooth surface, is the more capable of reflecting the rays of light; and thus it is that satin acquires that lustre and brilliancy, which distinguishes it from most other kinds of silks. The chief seats of this branch of manufacture, are Lyons in France, and Genoa and Florence in Italy. At these places they manufacture plain, embossed, striped, and embroidered satins, besides a great variety of other designs, whose colours and fabric have hitherto given them a decided superiority in the market. Very capital imitations of the foreign satins are made in Spitalfields, and in other parts of England; but we seldom export this article. There is a species of satin composed of a silken warp and a flaxen woof, made at Bruges in Flanders, whence it has received the denomination of *Bruges satin*. This sort is likewise imitated with success in England, and some other parts of Europe. *Satinet* is a kind of very light, thin satin, principally manufactured at Bruges, and usually employed in making furniture. From the East Indies are imported those light stuffs called Indian or Chinese satins. They are either plain, damasked, striped, open-worked, or embroidered. Both in lustre and execution, they are far inferior to the Lyonesse satins; they, however, possess this peculiar property, that even after scouring, they retain their original gloss.

SAUNDERS. See SANDERS.

SAWS, (GER. *Sägen*. DU. *Zaagen*. DA. *Sauge*, *Saver*. SW. *Säg*. FR. *Scies*. IT. *Seghe*. SP. *Sierras*. PORT. *Serras*. RUS. *Pili*. POL. *Pily*;) are instruments which serve to cut into pieces several solid matters; as wood, stone, ivory, &c.

The best saws are of tempered steel ground bright and smooth; those of iron are only hammer-hardened; hence, the first, besides their being stiffer, are likewise found smoother than the last. They are known to be well hammered by the stiff bending of

the blade; and to be well and evenly ground, by their bending equally in a bow. The edge, in which are the teeth, is always thicker than the back, because the back is always to follow the edge. The teeth are cut and sharpened with a triangular file, the blade of the saw being first fixed in a whetting-block. After they have been filed, the teeth are set, that is, turned out of the right line, that they may make the kerf or fissure the wider, that the back may follow the better. The teeth are always set ranker for coarse cheap stuff than for hard and fine, because the ranker the teeth are set, the more stuff is lost in the kerf. The saws by which marble and other stones are cut, have no teeth: these are generally very large, and are stretched out and held even by a frame.

The lapidaries, too, have their saw, as well as the workmen in mosaic; but of all mechanics, none have so many saws as the joiners; the chief are as follow: the pit-saw, which is a large two-handed saw, used to saw timber in pits; this is chiefly used by the sawyers.

The whip-saw, which is also two-handed, used in sawing such large pieces of stuff as the hand-saw will not easily reach. The hand-saw, which is made for a single man's use, of which there are various kinds; as the bow, or frame-saw, which is furnished with cheeks: by the twisted cords which pass from the upper parts of these cheeks, and the tongue in the middle of them, the upper ends are drawn closer together, and the lower set further apart. The tenon-saw, which being very thin, has a back to keep it from bending. The compass-saw, which is very small, and its teeth usually not set: its use is to cut a round, or any other compass-kerf: hence the edge is made broad, and the back thin, that it may have a compass to turn in.

SAW-MILLS. In early periods, the trunks of trees were split with wedges into as many and as thin pieces as possible; and if it was necessary to have them still thinner, they were hewn on both sides to the proper size. This simple and wasteful manner of making boards has been still continued in some places, to the present time. Peter the Great, of Russia, endeavoured to put a stop to it, by forbidding hewn deals to be transported on the river Neva. The saw, however, though so convenient and beneficial, has not been able to banish entirely the practice of splitting timber used in building, or in making furniture and utensils, for we do not speak here of fire-wood; and, indeed, it must be allowed that this method is attended with peculiar advantages, which that of sawing can never possess. The wood-splitters perform their work more expeditiously than sawyers, and split timber is much stronger than that which has been sawn; for the fissure follows the grain of the wood, and leaves it whole; whereas the

saw, which proceeds in the line chalked out for it, divides the fibres, and by these means lessens its cohesion and solidity. Split timber, indeed, turns out often crooked and warped; but in many purposes to which it is applied this is not prejudicial; and these faults may sometimes be amended. As the fibres, however, retain their natural length and direction, thin boards, particularly, can be bent much better. This is a great advantage in making pipe-staves, or sieve-frames, which require still more art, and in forming various implements of the like kind.

The use of the pit-saw succeeded the mode of splitting wood so long pursued; and its utility was found to be so great, that it was adopted in every civilised nation on the face of the globe.

The most beneficial and ingenious improvement of this instrument was, without doubt, the invention of saw-mills, which are driven either by water or by the wind. Mills of the first kind were erected so early as the fourth century, in Germany, on the small river Roer or Ruer: for though Ausonius speaks properly of water-mills for cutting stone, and not timber, it cannot be doubted, that these were invented later than mills for manufacturing deals, or that both kinds were erected at the same time. The art, however, of cutting marble with a saw, is very old. Pliny conjectures that it was invented in Caria; at least, he knew no building incrusting with marble of greater antiquity, than the palace of king Mausolus, at Halicarnassus. This edifice is celebrated by Vitruvius, for the beauty of its marble; and Pliny gives an account of the different kinds of sand used for cutting it, "for it is the sand properly," says he, "and not the saw, which produces that effect."

The latter presses down the former, and rubs it against the marble; and the coarser the sand is, the longer will be the time required to polish the marble which has been cut by it. Stones of the soap-rock kind, which are indeed softer than marble, and which would require less force than wood, were sawn at that period: but it appears that the far harder glassy kinds of stone were sawn then also; for we are told of the discovery of a building, which was incrusting with cut agate, cornelian, lapis lazuli, and amethysts. We have, however, found no account in any of the Greek or Roman writers of a mill for sawing wood; and as the writers of modern times speak of saw-mills as new and uncommon, it would seem that the oldest construction of them has been forgotten, or that some important improvement has made them appear entirely new.

When the infant Henry sent settlers to the island of Madeira, which was discovered in 1420, and caused European fruits of every kind to be carried thither, he ordered saw-mills to be erected also, for the purpose of sawing into deals the various species of ex-

cellent timber, with which the island abounded, and which were afterwards transported to Portugal. About the year 1427, the city of Breslau had a saw-mill, which produced a yearly rent of three marks; and in 1490, the magistrates of Erfurth purchased a forest, in which they caused a saw-mill to be erected, and they rented another mill in the neighbourhood besides.

Norway, which is covered with forests, had the first saw-mill about the year 1550. This mode of manufacturing timber was called the new art; and because the exportation of deals was by these means increased, that circumstance gave occasion to the deal-tythe, introduced by Christian III., in the year 1545. Soon after, the celebrated Henry Canzau caused the first mill of this kind to be built in Holstein. In 1552, there was a saw-mill at Joachimsthal, which, as we are told, belonged to Jacob Geusen, mathematician. In the year 1555, the bishop of Ely, ambassador from Mary, queen of England, to the court of Rome, having seen a saw-mill in the neighbourhood of Lyons, the writer of his travels thought it worthy of a particular description. In the sixteenth century, however, there were mills with different saw-blades, by which a plank could be cut into several deals at the same time. The first saw-mill was erected in Holland at Saardam, in the year 1596; and the invention of it is ascribed to Cornelius Cornelissen. Perhaps he was the first person who built a saw-mill at that place, which is a village of great trade, and has still a great many saw-mills, though the number of them is becoming daily less: for within the last thirty years a hundred have been given up. The first mill of this kind in Sweden, was erected in the year 1655. At present, that kingdom possesses the largest perhaps ever constructed in Europe, where a water-wheel, 12 feet broad, drives, at the same time, 72 saws.

In England, saw-mills had at first the same fate that printing had in Turkey; the ribbonloom, in the dominions of the church; and the crane at Strasburgh. When attempts were made to introduce them, they were violently opposed, because it was apprehended, that the sawyers would be deprived by them of their means of getting a subsistence. For this reason, it was found necessary to abandon a saw-mill erected by a Dutchman, near London, in 1663; and in the year 1700, when one Haughton laid before the nation the advantages of such a mill, he expressed his apprehension that it might excite the rage of the populace. What he dreaded, was actually the case in 1767 or 1768, when an opulent timber-merchant, by the desire and approbation of the Society of Arts, caused a saw-mill, driven by wind, to be erected at Limehouse, under the direction of James Stransfield, who had learned in Holland, and Norway, the art of

constructing, and managing, machines of that kind. A mob assembled, and pulled the mill to pieces; but the damage was made good by the nation, and some of the rioters were punished. A new mill was afterwards erected, which was suffered to work without molestation, and which gave occasion to the erection of others. It appears, however, that this was not the only mill of the kind then in Britain; for one, driven also by wind, had been built at Leith, in Scotland, some years before.

The mechanism of a sawing-mill may be reduced to three principal things: the first, that the saw is drawn up and down as long as is necessary, by a motion communicated by water to the wheel: the second, that the piece of timber to be cut into boards is advanced by a uniform motion to receive the strokes of the saw; for here the wood is to meet the saw, and not the saw to follow the wood, therefore the motion of the wood and that of the saw ought immediately to depend the one on the other: the third, that when the saw has cut through the whole length of the piece, the whole machine stops of itself, and remains immovable; for fear, lest having no obstacle to surmount, the force of the water should turn the wheel with too great rapidity, and break some part of the machine.

SAW-WORT, (GER. *Scharte*, *Farberscharte*. DU. *Verwend zaagblad*. DA. *Farveskiær*, *Engeckier*. SW. *Angskärä*. FR. *Sarrette*, *Serrette*. IT. *Serratola*. SP. and PORT. *Serratula*. RUS. *Serp*, *Serpucha*. POL. *Sierpick*. LAT. *Serratula tinctoria*.) This plant is employed by dyers to impart a yellow colour; but, being inferior to the dyer's weed, its use is chiefly confined to the coarser woollen cloths, and as an ingredient in other dyeing drugs, in combination with indigo; the common saw-wort strikes a permanent green colour; its leaves readily yield a brownish-yellow decoction, which, on being diluted with water, changes to a brighter tinge, and by adding a solution of pure pot-ash, acquires a darker shade: but on dropping into it a little of the spirit of sal-ammoniac, becomes a reddish-brown, which may again be rendered of a golden tint, by the addition of pure water. Alum and gypsum appear to be best calculated for extracting a fine yellow colour from this plant, which the Germans industriously cultivate.

SAY, or **SAVE**, a kind of serge or woollen stuff, much used abroad for linings, and by the religious of some orders for shirts: with us it is employed as aprons, by several descriptions of artificers, being usually dyed green.

Some of the manufacturers in Belgia make says of very superior quality, which are entirely formed of Segovian, or English wool. These are usually 7-8ths in breadth; but some sorts are only 5-4ths. The latter are

made from the wools of the country itself. The denomination of say is likewise bestowed upon a remarkably stout kind of cloth, of which the Turks make short cloaks and vests for winter wear. The only colours given to this species of stuff are bright scarlet and dark red.

SAXON-GREEN, a fine bright, green colour, employed in dyeing. See **DYE-ING**.

SCALES. See **BALANCES**.

SCALIN, a silver coin, current in the French West Indies, at $5\frac{1}{2}$ sterling. There is likewise the half-scalin, equivalent to $2\frac{1}{2}d$. Scalin is also a silver money which passes in the Netherlands, at $6\frac{1}{2}d$. and here is besides an imaginary specie rated at $5\frac{1}{2}$ of our English penny.

SCAMMONY, (GER. *Skammonien*. DU. *Skammoneum*. DA. *Skammonium*. SW. *Skammonium*. FR. *Scammonée*. IT. *Scammonea*. SP. and PORT. *Escamonea*. LAT. *Scammoneum*.) is the produce of a species of convolvulus, or creeper plant; which grows wild in the vales between Nazareth and Mount Carmel. The scammony is prepared from the root and the stalk of the plant, and when genuine ought to be like a fine clear gum, of a darkish gray, light and brittle, and in chewing, ought to yield a white milky froth. The best scammony is brought from Marasch, a town about four days' journey from Aleppo, near the confines of Armenia. It is thence carried to Aleppo, in small skins, and by the merchants sent to London and Marseilles.

Scammony is used in medicine as a purgative.

SCANTLING, irregular timber or boards, reduced to the standard measure.

SCAPOLITE, a mineral found at Arendal, in Norway. It is of a pearl-colour, and is crystallized in long, four-sided, rectangular prisms. Faces longitudinally streaked.

SCARLET, a beautiful bright-red, employed in painting and in dyeing. See **DYEING** and **PAINTING**.

SCARLET-BERRIES. See **KERMES**.

SCATES, or **SKATES**, (GER. *Schlittschuhe*. DU. *Schaatsen*. DA. *Glideskoe*. SW. *Skridskor*. FR. *Patins*. IT. *Pattini*. SP. *Patines*. PORT. *Patinos*. RUS. *Konki*. POL. *Kosle Lyze*, *Narty*.) are a sort of wooden shoe, with a steel or iron plate underneath, used for sliding upon the ice. In England, these are merely considered as toys, used for the purposes of recreation; but in Holland, and some more northerly countries, scates occupy the place of vehicles, by enabling persons to pass with facility from one town or village to another, over frozen rivers and canals. Scates, which are principally manufactured at Birmingham, and Sheffield, are exported to the northern countries of Europe, and to America.

SCAVALGE, a toll or custom, anciently exacted by mayors, sheriffs, and bailiffs, of

cities and towns corporate, and of merchant-strangers, for wares exposed and offered to sale within their liberties, which was prohibited by 19 Hen. 7. But the city of London still retains this custom. See **PACKAGE**.

For the table of **SCAVAGE-DUTIES**, payable at the port of London, see **PACKAGE**.

SCHAN, or **SCHANG**, a weight used in the kingdom of Siam. The Chinese cati is equal to two Siamese schans; so that the former being 16 taels, the latter must be only 8, though some reckon the cati at 20 taels, and the schan at 10. The tael weighs four baats or ticals, each of nearly half an ounce; the baat four selings or mayons: the mayon two fouangs; the fouang four payes; the paye two clams; and the clam weighs twelve grains of rice; so that the tical or baat weighs 768 of those grains. See **BAAT**.

It is to be observed, also, that the greatest part of those weights pass for money, either real or in reckoning.

SCHARIFI, a golden coin formerly made in Egypt, and of the same value as the sultanin. The Arabians call it dinar, or metcalald-hegel; but it is at present rarely to be met with.

SCHEDULE, a scroll of paper or parchment, annexed to a will, lease, or other deed, containing a particular inventory of goods, not enumerated in the body of the deed, &c.

Schedule likewise implies the account or statement of his affairs, delivered by a bankrupt to the commissioners appointed to investigate his case.

SCHEREFI, a golden coin current in Persia, worth eight larins, at the rate of nine shillings British, *per* larin; the Europeans call it *golden scruphin*.

SCHERIF, otherwise called **SULTANIN**, *which see*.

SCHILLING, the name of a Dutch silver-money, current at 6*d.* and of a Danish and Norwegian money of account, reckoned at 1-32 of a penny sterling. The *schilling-lub* is a German silver coin, and passes for 1½*d.* of our money.

SCHOONER, a small vessel, usually a fast sailer, and principally employed in trade by those who make speculations where dispatch is requisite.

SCHOPPEN, a liquid measure of Strasbourg.

SCHUITE D'ARGENT, a money of account at Japan, by which payments in trade are estimated, being equivalent to 12½ Dutch guilders. It is, otherwise, reckoned equal to four taels, six mace, and five condorins; the value of them varying a little, according to circumstances.

SCISSARS, or **SCISSORS**, (*GER. Scheeren. Du. Schaaren. DA. Saxe. Sw. Saax. FR. Ciseaux. IT. Cesoje, Forbici. SP. Tijeras. PORT. Tesouras, Tesourinhos. RUS. Noshnizii. POL. Nozyce.*) are instruments used for cut-

ting with, the construction of which is so well known, as to need no particular description. Scissars are of various sizes, according to the purposes for which they are designed, and when remarkably large, such as those used by tailors, book-binders, &c., they are commonly denominated shears. Those implements which are properly called scissars, are chiefly employed by mantua-makers and milliners, and are made of fine polished steel, or iron. The best scissars are manufactured at Sheffield, and London.

SCORE, the number of twenty.

SCOT AND LOT, a customary contribution laid upon all persons according to their ability. Persons assessed to any contribution are generally said to pay *scot and lot*.

SCOURER. The business of this workman consists in cleaning or scouring clothes, either wet, or dry; and is pretty laborious.

Water, as well as many dry detergents, such as fuller's earth, &c., is used by the scourer in the course of his occupation.

SCREWS. (*GER. Schrauben. Du. Schrüeven. DA. Scrue, Skrue. Sw. Skrufvar. FR. Vis. Verrins. IT. Viti, Verricelli. SP. Tornillos, Husillos. PORT. Parafusos. RUS. Schtschurupi. POL. Szruby.*) The screw is one of the principal of the mechanical powers. Screws are divided into male, and female: the male screw is cut in such a manner as to have a prominent part going round the cylinder in a spiral form, which prominent part is called the thread of the screw; the female screw, or inside screw, is a solid body, containing a hollow cylinder, whose concave surface is cut in the same manner as the convex surface of the male screw, so that the prominent parts of the one may fit the concave part of the other. Screws are used for various purposes, which it would be alike tedious, and unprofitable, to attempt to enumerate; they are chiefly made at Birmingham, Wolverhampton, Dudley, &c.

SCRIBBLING, is a term used to express a process performed by an engine, commonly called a scribbling mill, in preparing woollen cloth. The wages due to persons engaged in the species of work performed by one of these mills became the subject of a decision, in the court of K. B. in 53 Geo. 3. *see* R. v. Heywood & al. 1 M. & S. Rep. 624.

SCRIBING, in joinery, &c. is a term used when one side of a piece of stuff is to be fitted to another that is irregular. In order to make these join close all the way they scribe it, that is, they lay the piece to be scribed close to that they intend to scribe it to, and opening their compasses to the widest distance these two pieces stand from each other, they bear the point of one of the legs against the side they intend to scribe to, and with the other point draw a line on the stuff to be scribed. Thus they form a line on the irregular piece parallel to the edge of the

regular one; and if the stuff is cut exactly to the line, when these pieces are put together they will seem a joint.

SCRIP. A term used to signify those remaining shares of the different articles, which make up the terms of a loan to government, in the hands of individuals, who have not paid up their whole sub—*scrip*—tions. The value of scrip is, like all other property, governed by the price of stocks, of a fluctuating kind. Its value, at any particular moment, is ascertained by deducting the amount of the payments remaining due from the whole amount at the market price of the same stock.

SCRIVELLO, or SCRIVELLI, are the small elephants' teeth, or pieces of them, or of the large ones, which are not sold singly, but in parcels.

SCRIVENER, one whose profession is, to engross all writings for the attornies, on paper, vellum, or parchment; and no attorney in the city of London can employ his own clerk in engrossing, without paying a valuable consideration to the company of scriveners for a license to do it. The scriveners, sometimes, also practise the business of a notary public; and at others sell their own stamps, with various articles of stationery, &c. in which last case they go under the denomination of writing-stationers.

Scriveners are liable to the bankrupt laws, and attorneys charging procuration fees for loans may be made bankrupts as scriveners.

SCRUPLE, a weight equal to the third part of a drachm, or to twenty grains. This is the apothecaries' scruple; the goldsmiths' is equal to twenty-four grains troy.

SCUDI, an Italian money of account and silver coin. The imaginary specie is equivalent to 4s. 3d. The silver scudi passes in most parts of Italy at 4s. 3d.; but at Milan, Modena, Parma, and Pavia, it is current at 4s. 2½d.; while, on the contrary, at Turin, Chambery, Cagliari, and in Sardinia, it is equivalent to 4s. 6d. British.

SCULPTURE, is an art, in which, by means of taking from, or adding to, matter, all sorts of figures are formed; as in clay; wax; wood; marble, or other stones; or in metal.

The art of sculpture, in its most extensive sense, comprehends not only carving in wood, stone, &c. but also enchasing, engraving in all its kinds, and casting in bronze, lead, wax, and plaster of Paris, as well as modelling in clay, wax, or stucco.

Works of sculpture are performed either by hollowing or excavating, as in metals, agates, or other precious stones, and in marbles of every description; or by working in relief, as in bas-reliefs, in the materials just mentioned, or in statues in metal, clay, woods, &c.

The excavation of precious stones forms a particular branch of the art called *intaglio*, which, together with the working them in

relievo, (when the term *cameo* is applied to them,) appertains to the art of seal-engraving. See ENGRAVING AND INTAGLIO.

The excavation of metals constitutes the art of engraving in its various branches, on metal of any kind; and its relief comprises enchasing, casting in bronze, &c.

Of Sculpture in Wax, or Clay. — As not only the beginning of sculpture was in clay, for the purpose of forming statues; but as models are still made in clay, or wax, for every work undertaken by the sculptor; we shall first consider the method of modelling figures in those materials.

Few tools are necessary for modelling in clay. The clay being placed on a stand or sculptor's easel, the artist begins the work with his hands, and puts the whole into form by the same means. The most expert practitioners of this art seldom use any other tool than their fingers, except in such small, or sharp, parts of their work, as the fingers cannot reach. For these occasions, they are provided with three or four small tools of wood, about seven or eight inches in length, which are rounded at one end, and at the other flat, and shaped into a sort of claws. These tools are called by the French *ebauchoirs*. In some of these the claws are smooth, for the purpose of smoothing the surface of the model; and in others, are made with teeth, to rake or scratch the clay, which is the first process of the tool on the work, and in which state many parts of the model are frequently left by artists, to give an appearance of freedom and skill to their work.

If clay could be made to preserve its original moisture, it would undoubtedly be the fittest substance for the models of the sculptor; but when it is placed either in the fire, or left to dry imperceptibly in the air, its solid parts grow more compact, and the work shrinks, or loses a part of its dimensions. This diminution in size would be of no consequence, if it affected the whole work equally, so as to preserve its proportions. But this cannot be the case: for, the smaller parts of the figure drying sooner than the larger; and thus losing more of their dimensions in the same space of time, than the latter do; the symmetry and proportions of the work inevitably suffer.

This inconvenience, however, is obviated by forming the model first in clay, and moulding it in plaister of Paris before it begins to dry, and then taking a plaister cast from that mould, and repairing it carefully from the original work; by which means you have the exact counterpart of the model in its most perfect state.

In order to model in wax, you must prepare the wax in the following manner: to a pound of wax add half a pound of scammony, (some mix turpentine also,) and melt the whole together with oil of olives; put-

ting more, or less, oil as you would have your modelling-wax harder, or softer. Vermilion is sometimes mixed with this composition, to give it a reddish colour, in imitation of flesh.

Whatever considerable work is undertaken by the sculptor, whether bas-relief, or statue, &c. it is always requisite to form a previous model of the same size as the intended work; and the model being perfected, according to the method before described, whether it be in clay, or in wax, or a cast in plaister of Paris, becomes the guide for the artist, and the standard from which he takes all its measurements. In order to regulate himself more correctly by it, he puts over the head of the model an immoveable circle, divided into degrees, with a moveable rule fastened in the centre of the circle, and likewise divided into parts. From the extremity of the rule hangs a line with a lead, which directs him in taking all the points, which are to be transferred from the model to the marble; and from the top of the marble is hung also a line, tallying with that which is hung from the model; by the correspondence of which two lines, the points are ascertained in the marble.

Many eminent sculptors prefer measurements taken by the compasses to the method just described; for this reason, that if the model be moved but ever so little from its level, the points are no longer the same.

This method, however, offers the best means by which mechanical precision may be attained; but it is manifest, that enough yet remains to exercise, and display, the genius and skill of the artist. For, first, as it is impossible, by the means of a straight line, to determine with precision the procedure of a curve, the artist derives from this method no certain rule to guide him, as often as the line, which he is to describe, deviates from the direction of the plumb-line. It is also evident that this method affords no certain rule to determine exactly the proportion, which the various parts of the figure ought to bear to each other, considered in their mutual relation and connections. This defect, indeed, may be partly supplied by intersecting the plumb-lines by horizontal ones; but even this resource has its inconveniencies; since the squares formed by transversal lines that are at a distance from the figure, (though they be exactly equal,) yet represent the parts of the figure as greater, or smaller, according as they are more, or less, removed from our point of view.

Of sculpture in Wood.—A sculptor in wood requires wood of the best quality, and the most proper kind. If he undertake a large work requiring strength, and solidity, he ought to choose the hardest wood, and that which keeps best, as oak, and Spanish chesnut; but for works of moderate size, pear, or apple, tree serve as well. Even

these latter woods are of a considerable hardness; therefore, if the work consist only of delicate ornaments, some more tender wood, provided it is at the same time firm and close, may be preferable; for instance, the Indian tree, which is excellent, as the chisel cuts it more neatly, and easily, than any other wood. Sycamore is much used.

The beauty of sculpture in wood, consists in the tender manner of cutting the wood, free of all appearance of hardness, or dryness.

For any work of large dimensions, even though it consists of a single figure, it is better to join together several smaller pieces of wood, than to make the whole of a single large piece; which is more liable to warp and crack, on account of its not being always equally, and perfectly, dry throughout.

No wood can be properly fit for works of this kind, that has not been cut several years, and well prepared by seasoning.

The tools used for sculpture in wood, are the same as those of the joiner or cabinet-maker.

Of sculpture in Stone and Marble.—For sculpture in marble, and other stone, tools of good steel, well tempered, and of strength proportioned to the hardness of the material, are necessary.

The first thing to be done, is to saw out, from a larger mass, a block proportioned to the size of the object which is to be produced. The sculptor then shapes the gross masses of the forms he designs to represent, by knocking off the superfluous parts of marble with a strong mallet or beel, and a strong steel tool called a point.

When the block is thus hewn out agreeably to the measures previously taken for the performance of the work, the sculptor brings it nearer to the intended form by means of a finer point; and sometimes of a tool called a dog's tooth, having two points, but less sharp than the single one.

After this he uses the gradine, which is a flat cutting tool, with three teeth, but is not so strong as the point.

Having advanced his work with the gradine, he uses the chisel to take off the ridges left by the former tools; and by the dexterous and delicate use of this instrument, he gives softness and tenderness to the figure, till at length, by taking a rasp, which is a sort of file, he brings his work into a proper state for being polished.

Rasps are of several kinds, some straight, some curved, and some harder, or softer, than others.

When the sculptor has thus far finished his work with the best tools he can procure, wherever certain parts require polishing, he uses pumice-stone to make them smooth and even. He then goes over them with tripoli, and when he would give a still higher gloss, he rubs them with leather and straw-ashes.

Besides the tools already mentioned, sculp-

tors use also the pick, which is a small hammer pointed at one end, and at the other formed with teeth made of good steel, and squared, to render them the stronger. This serves to break the marble, and is used in all places where the two hands cannot be employed to manage the mallet and chisel.

The bouchard, which is a piece of iron, well steeled at the bottom, and formed into several strong, and short, points like a diamond, is used for making a hole of equal dimensions, which cannot be done with cutting tools. The bouchard is driven with the mallet or beetle, and its points bruise the marble, and reduce it to powder. Water is thrown into the hole from time to time, in proportion to the depth that is made, to bring out the dust of the marble, and to prevent the tool from heating, which would destroy its temper; for the free-stone dust, on which tools are edged, is only moistened with water to prevent the iron from heating, and taking off the temper of the tool, by being rubbed dry; and the trepans are wetted for the same reason.

The sculptor uses the bouchard to bore or pierce such parts of his work, as the chisel cannot reach, without danger of spoiling or breaking them. In using it, he passes through a piece of leather, which leather covers the hole made by the bouchard, and prevents the water from spirting up in his face.

The other tools necessary for sculpture on marble, or stone, are the roundel, which is a sort of rounded chisel: the houguet, which is a chisel squared and pointed; and various compasses to take the requisite measures.

The process of sculpture in stone is nearly the same as in marble, excepting that the material being less hard than marble, the tools used need not be so strong, and some of them are of a different form, as the free-stone is apt to scale, and does not work like hard stone, or marble.

Sculptors in stone have commonly a bowl in which they keep a powder composed of plaister of Paris, mixed with the same stone in which their work is executed. With this composition they fill up the small holes, and repair the defects which they meet with in the stone itself.

Several statutes attach upon the subject of sculpture. The 58 Geo. 3. c. 71. and 54 Geo. 3. c. 56. secure the property in them to the inventors. The 41 Geo. 3. c. 89. regulates the duty to be paid on the importation of them per ton-weight.

SCURVY-GRASS, (GER. *Löffelkraut*. DU. *Lepelkruid*. DA. *Skeært*, *Skjörbugsur*. SW. *Sködort*, *Skjörhuggsgräs*. FR. *Cranson*. IT. *Coclearia*. SP. *Cochlearia*, *Coclearia*. PORT. *Cochlearia*. RUS. *Loshetschnaja trawa*. POL. *Warzecha ziele*. LAT. *Cochlearia*.) a plant which is commonly grown in our gardens. It is propagated by seeds, which should be sown in July: in spring they will be fit for use. Scurvy-grass is particularly

celebrated in scurvy, and is the principal herb employed in these disorders in the northern countries. It is supposed to constitute the principal portion of several patent medicines in great request.

SCUTTLES, in a ship, square holes cut in the deck, big enough to let in the body of a man, serving to let people down into any room below upon occasion, or from one deck to another. They are generally before the main-mast, before the knight in the fore-castle: in the gun-room, to go down to the stern-sheets; in the round-house, to go down into the captain's cabin, when forced by the enemy in a fight aloft. There are also some smaller scuttles, which have gratings over them: and all of them have covers, that people may not fall down through them in the night.

Scuttle is also a name given those little windows and long holes which are cut out in cabins to let in light.

SCYTHES, (GER. *Sensen*. DU. *Seissen*. DA. *Leer*. SW. *Liar*. FR. *Faux*, *Fault*. IT. *Falci*. SP. *Guadanas*. PORT. *Fouces*, *Gadanhos*. RUS. *Kossii*. POL. *Kosy*.) the instrument of mowing; consisting of a curved blade, joined at right angles to a long pole. The best scythes are manufactured principally at Sheffield, whence vast quantities are exported to Ireland, the Continent of Europe, and North America.

SEA-CHART, a map on which only the coasts are delineated.

SEA-COAL, mineral coal, so called because brought to London by sea. See COAL.

SEA-HORSE. See MORSE.

SEAL, in zoography, (GER. *Seehund*, *Robbe*. DU. *Zeehond*. DA. *Sælhund*, *Sæl*. SW. *Sjæl*. FR. *Phoque*, *Vean marin*. IT. *Foca*, *Vitello marino*. SP. *Foca*, *Bercero marino*. PORT. *Phoca*, *Vitello ou bezerro marinho*. RUS. *Tzuden*, *Nerpa*. POL. *Ciele morskie*. LAT. *Phoca*, *Vitulus marinus*.) an animal of the amphibious kind, a native of the European seas, and found about all the coasts of the northern hemisphere, and even extending to the southern polar regions. It also inhabits some fresh water lakes, as those of Baikal, Oron, &c. Seals are generally very fat, and are hunted in the northern regions for the sake of their oil, which forms a considerable article of commerce. The bottle-nosed seal is usually so excessively fat, as to resemble a skin of oil, the tremulous motion of the blubber being plainly perceivable beneath the skin. A single animal of this species has been known to yield a butt of oil. The skin of the seal yields a very fine species of fur, which hatters employ as a substitute for beaver. The seal-skins are likewise used for covering trunks, and for other purposes.

SEAL, (GER. *Petschotte*. DU. *Zegelen*. DA. *Signet*. SW. *Pitser*. FR. *Eachets*. IT. *Sigilli*. SP. and PORT. *Sellos*. RUS. *Petschatii*. POL. *Pieczatki*.) the instrument em-

ployed for impressing sealing-wax. It was an early invention to identify instruments, before signatures were used. Seals are usually formed of cornelian, agate, or other valuable gems, mounted in gold and neatly engraven. Vast quantities of gilt seals, and seals made of stained glass, &c. mounted in gilt copper, are manufactured at Birmingham, and thence exported to Spain, Portugal, France, and other parts of Europe, as well as to North, and South, America.

SEALED-EARTH, (GER. *Siegelerde*. DU. *Zegeläarde*. DA. *Sejglejord*. SW. *Sigillera*. FR. *Terre sigillée*. IT. *Terra sigillata*. SP. *Tierra sijilata*. PORT. and LAT. *Terra sigilata*.) is brought from the island of Lemnos, where it is found in great abundance. It is thus named on account of the print, or seal, with which they impress it. It is considered an excellent antidote against the bite of a snake, in venomous wounds, and the bloody flux. The Lemnian curriers use it as a substitute for tan, in dressing hides. That which is sold at Constantinople is usually adulterated, and the pieces are commonly larger than the genuine. • Its colour is likewise different, being generally yellowish, whereas the genuine is red. The surest indication of this earth, is a peculiar unctuousity, which causes it, when taken in the mouth, to have the flavour and consistence of tallow, so that it adheres to the teeth and tongue, and when moistened with saliva, or thrown into water, blisters or rises into bubbles. The genuine earth, when chewed, emits an extremely fragrant odour, insomuch that if persons were not aware of this circumstance, they would be led to imagine that it was adulterated with aromatic spices. There is a considerable trade in sealed-earth from the island of Lemnos; but it is most certain, that the greater part of what is sold in the shops, is adulterated, or wholly counterfeit.

SEALING. This is an essential part of every deed, and if the seal be torn off it will be tantamount to cancelling, or rendering such deed void; and where several are bound in a bond or obligation, pulling off the seal of one will make such deed void as to all the other parties.

SEALING-WAX, (GER. *Siegellack*. DU. *Brieflak*, *Zegellak*. DA. *Sejglak*. SW. *Sigillvar*. FR. *Cire d'Espagne*, *Cire à cacheter*. IT. *Cera Lacca*, *Cera di Spagna*. SP. and PORT. *Lacre*. RUS. *Surgutsch*. POL. *Lak*.) is the wax used for sealing letters, legal instruments, &c. It is a composition of gum-lac, melted, and incorporated with resin, and afterwards coloured with some pigment, as vermilion, verditer, ivory-black, &c.

There are two kinds of sealing-wax generally used; the one hard, for sealing letters, legal instruments, &c. and the other soft, for receiving the impressions of seals of office to charters, patents, and other written documents.

The following is the method of preparing the best hard red sealing-wax: take two parts of shell-lac, with one of resin, and one of vermilion; let these ingredients be reduced to a fine powder, melt them over a moderate fire, and when they are thoroughly incorporated, roll the composition into sticks: seed-lac may be substituted for the shell-lac, and boiled Venice turpentine may be employed instead of resin. A coarser kind of such sealing-wax may be manufactured, by mixing equal parts of resin, and of shell-lac, (or vermilion and red-lead, in the proportion of one part of the former to two of the latter,) then proceeding in the manner above directed; but where large quantities of this wax are consumed, both the vermilion, and shell-lac, are generally omitted, so that it may be obtained at a much cheaper rate.

Black sealing-wax is composed of gum-lac, or shell-lac, melted with one-half, or one-third, of its weight of levigated ivory-black. To prevent the composition from becoming too brittle, Venice turpentine, in the proportion of *two-thirds* of the above ingredients, is usually added, as it likewise contributes to improve the beauty of the manufacture. These substances being melted, and properly stirred over a slow fire, the liquid is next poured upon an iron plate or stone, previously oiled, and while soft, it must be rolled into sticks, which are then exposed to heat till they acquire a glossy surface.

Uncoloured soft sealing-wax is commonly prepared of bees' wax 1lb., of turpentine 5oz., and of olive-oil 1 oz.: these ingredients are carefully boiled in a proper vessel for some time, till the compound becomes fit to be formed into rolls, or cakes, for use; and in order to impart to it the requisite colour, one ounce, or more, of either of the pigments above-mentioned may be added, stirring the mass till the whole be duly combined.

SEAMEN. The following are the chief laws and regulations relative to seamen, and the wages of mariners.

1. *Agreement in writing*. Every seaman, who ships himself on board a merchant ship for any voyage, shall be obliged to sign an agreement for wages within three days. 2 Geo. 2. c. 36. s. 2. And, by the act of 31 Geo. 3. c. 39. this regulation is extended to the coasting trade.

2. *Deserting*. If any seaman desert, or refuse to proceed on the voyage, after signing such contract, he shall forfeit to the owners all the wages due to him. If any such seaman absent himself from such ship after signing, the master may apply to any justice for a warrant to apprehend him: and, if he shall refuse to proceed on the voyage without sufficient reason, the justice shall commit him to the house of correction. 2 Geo. 2. c. 36. s. 3 & 4.

3. *Absent without leave*. If any seaman absent himself from the vessel to which he be-

longs without leave, he shall, for every day's absence, forfeit two days' pay to the use of Greenwich-hospital. 2 Geo. 2. c. 36. s. 5.

4. *To be discharged by writing.* If any seaman leave the vessel to which he belongs, without receiving his discharge in writing from the master, unless he enters into his majesty's service, he shall forfeit one month's pay. 2 Geo. 2. c. 36. s. 6.

5. *When wages are to be paid.* On arrival in Great Britain, the master shall pay the seamen their wages, if demanded, in thirty days after entry at the custom-house, or at the time the seamen shall be discharged, (whichever shall happen first,) deducting therefrom the above-mentioned penalties, under the forfeiture of 20s. to every such seaman unpaid. 2 Geo. 2. c. 36. s. 7.

6. *Refusing to defend the ship.* If any mariners or inferior officers of any merchant-ship shall decline or refuse to defend the ship, or utter words to discourage others from doing so, every mariner so behaving shall lose all his wages, together with such goods as he may have in the ship, and suffer imprisonment for a time not exceeding six months. And every mariner, who shall have laid violent hands on his commander, to hinder him from fighting in defence of his ship and goods, shall suffer death as a felon. 22 & 23 Car. 2. c. 11. s. 7 & 9.

7. *Wilfully losing the ship.* If any master, mariner, &c., shall wilfully cast away, burn, or destroy his ship, or procure the same to be done, he shall suffer death as a felon. 22 & 23 Car. 2. c. 11. s. 12.

8. *Negligence of mariners.* Masters may reimburse themselves, out of the wages of their mariners, for losses happening by their negligence. *Raymond's Rep.* p. 650.

9. *Suing for wages in the Admiralty.* The convenience arising to mariners in suing for wages in the Admiralty is so great, that, out of regard to that useful body of men, it is permitted that they may sue for wages there. But, this liberty permitted to mates and mariners, is denied to the master: and moreover the mariners may *all join* in a suit there for wages, thereby lessening the expense: and in the Admiralty, the ship itself is answerable and not the owners.

Even if a master of a ship designs to go a voyage, and hires, and takes on board, seamen in order to it; afterwards the owners cannot agree about sending the ship the voyage, and the seamen are thereupon discharged; the seamen have the same remedy in the Admiralty for their wages as if the ship had gone the voyage.

10. *In what cases wages are due.* If a ship be lost before she arrives at any port of delivery, the seamen lose all their wages. If she be lost after coming to a port of delivery, they only lose their wages from the last port of delivery; and, even though the officers and mariners gave bond not to demand wages unless the ship returned to London, she ar-

rived at a delivering-port, and afterwards was taken by an enemy, they had their wages to the delivering-port. If they run away, though after coming to a port of delivery, they lose all their wages.

If a ship outward-bound arrives at her destined port, unloads there, receives freight to return to England, and is taken by enemies in her return, the mariners shall have their wages to the time she arrived at the port she unloaded in, and for half the time she staid there to unload.

If a seaman be impressed before the ship arrive at the delivering-port, and she afterwards arrive there safe, his wages are recoverable for the time he served; and if articulated for a certain voyage, and before he have performed it, he be disabled by accident happening in the course of his duty, he is entitled to his whole wages. *Chandler v. Grieves.* 2 H. B. 606.

An action was brought by a sailor for wages in a voyage from Barnstaple to Newfoundland, and thence to Spain, Portugal, or some port in the Mediterranean. The ship was taken after her arrival at Newfoundland, and the action was brought for the wages due on that part of the voyage. Verdict was given for the defendant; but, on motion for a new trial, it was the opinion of the court that it was all one entire voyage. The fish is only the lading of the ship; (no matter where taken in;) and the ship was lost before its arrival at the port of delivery: as the freighter lost his cargo, the mariner ought to lose his wages.

A sailor was hired for a voyage from Jamaica to Liverpool, and took, of the captain, this promissory-note: "Ten days after the ship, Governor Parry, myself master, arrives at Liverpool, I promise to pay to Mr. T. Cutter the sum of thirty guineas, provided he proceeds, continues, and does his duty, as second mate in the said ship, from hence to the port of Liverpool. Kingston, July 31. 1795." The ship sailed on the 2d of August, and arrived at Liverpool on the 9th of October following; but T. Cutter died on his passage the 20th of September. An action was brought by his administratrix: and the court were of opinion, that, as there was no general usage among merchants with respect to these notes in such a case as the present, they must decide that, as T. Cutter did not continue to do his duty till arrival at Liverpool, his representative could recover nothing even for that part of the time in which he did duty. *Cutter v. Powel*, 6 Term Rep. 320.

The cargo of a ship was lost by the capture of a Swedish privateer, who carried her into Gottenburgh: the master staid there three months to refit and take in new lading; and, to prevent the seamen from going away, he agreed to pay them so much a month while they staid there. And, in an action for this, the master would have dis-

charged himself on the rule, that *freight is the mother of wages, and that none are ever paid while the ship is lading and unlading*; which the chief-justice agreed to be the general doctrine: but he held it not sufficient to set aside a special agreement, as there was in this case. The seamen therefore recovered their wages.

The abuses that existed, by desertion of seamen from merchant-ships in the West-India trade, gave rise to an act of parliament, 57 Geo. 3. c. 73.

For preventing Desertion of Seamen from British Merchant Ships trading to His Majesty's Colonies and Plantations in the West Indies.

1. *Seamen deserting forfeit their wages.* From the first day of July, 1797, every seaman, mariner, and other person, who shall desert at any time during the voyage, either out or home, from any British merchant-ship trading to or from the West-India colonies or plantations, shall, over and above all punishments, penalties, and forfeitures, to which he is now by law subject, forfeit all the wages he may have agreed for with, or be entitled to, during the voyage, from the master or owner of the ship on board of which he shall enter, immediately after such desertion.

2. *Masters hiring seamen who have deserted.* Every master or commander of any British merchant-ship, who shall hire, or engage to serve on board his ship or vessel, any seaman, &c., who shall, to the knowledge of such master, have deserted from any such ship or vessel, shall forfeit and pay one hundred pounds.

3. *Upon what terms seamen may be hired in the West Indies.* No master or commander of any merchant-vessel shall hire or engage any seamen, &c., at any port or place in the West Indies, to serve on board any such merchant-vessel, at greater wages than double of the monthly wages contracted for with the seamen, &c., hired to serve on board such vessel at the time of her then last departure from Great Britain, being in the same degree and station as such seamen, &c., unless the governor, chief-magistrate, collector, or comptroller, of such port or place, shall think that greater wages ought to be given, and shall accordingly authorise the same to be given, by writing under his hand. And all contracts, bonds, bills, notes, and other securities, promises, and undertakings, made contrary hereto, shall be null and void to all intents and purposes; and every person who shall make, or enter into, any such contract, &c., or who shall hire, or procure to be hired, any seamen, &c., to enter on board any vessel contrary hereto, or who shall pay, or procure to be paid or given, any greater wages, or other gratuity or advantage whatsoever, to or for any seaman, &c., as aforesaid, than is allowed by this act, shall, for

every such offence, forfeit one hundred pounds.

A general licence by a chief-officer, "to procure men on such terms as he can," was held not to be sufficient authority to give greater wages than allowed by the act. *Rogers v. Lacy*, 2 B. & P. 57.

4. *Ships to have apprentices.* Every master of any merchant-ship trading to the West Indies, shall have on board his ship, at the time of clearing out from Great Britain, one apprentice under the age of seventeen years, duly indentured for three years, for every 100 tons, admeasurement, and so in proportion for every 100 tons, according to the certificate of registry, which certificate shall be duly enrolled, &c. and the said apprentices shall be exempt from serving in his majesty's navy for three years from the date of such indentures; and every owner, or master, neglecting to enrol the same, shall, for every such offence, pay ten pounds, to be paid, one moiety by the owner and the other moiety by the master.

5. *Masters to deliver lists of certain particulars.* Every master of such ship shall, within ten days after arrival out at any port, in the said colonies or plantations, and also within ten days after arrival home at any port in Great Britain, deliver, upon oath before the collector or comptroller of such port, a true and exact list and description of all the crew on board at the time of their clearing out from any port or ports in Great Britain, and also of the crew on board the same, at the time of their arrival at any port or ports in the said colonies or plantations; and also a true and exact list and description of every seaman, mariner, or other person, who has deserted from such ship, or who has died during the voyage; and also, a true account of the wages due to such seaman, &c. at the time of his death; under a penalty of fifty pounds.

6. *No seaman entitled to greater wages than herein authorised.* No seaman, mariner, or any other person, who shall, at any port or place in the West Indies, engage himself to serve, or who shall enter on board any merchant-vessel, which shall sail from Great Britain after the 1st of July, 1797, shall be entitled to or receive any greater wages or hire, or other gratuity or advantage whatsoever, than such wages or hire as hereinbefore authorised.

7, 8. *Wages of dead men.* The wages due to any seaman, mariner, or other person, hired, or engaged on board any British merchant-ship for any voyage from any port in Great Britain to any port in the West Indies, and who has died on board during the voyage, shall, within three calendar months after arrival in Great Britain, be paid to the receiver of the sixpenny duty for Greenwich-hospital to the use of the executor or administrator; and, if any master shall neglect, or refuse to pay the same to

the said receiver, he shall pay, for every such offence, fifty pounds; and also double the amount of the wages due. And, if the said wages be not lawfully demanded of the said receiver within three years after the payment thereof to him, they shall be forfeited to the seamen's hospital of the port to which such ship belongs; but, in case there should be no seamen's hospital at that port, then to the use of the old and disabled seamen of the same port, and their families, to be distributed at the discretion of the magistrates for the county where such port shall be situated, or any two or more of them.

When the captain of a ship has accounted upon oath to the collector of the port for a sum of money as wages due to a deceased seaman, and paid the sum to Greenwich-hospital, the representatives of such seaman may still sue the captain for any wages due beyond the sum so paid. *Armstrong v. Smith*, 1 N. R. 299.

9. *Disposition of penalties.* The penalties, &c. by this act shall be applied, one-third part to Greenwich-hospital; one-third part to the seamen's hospital at the port to which the ship or vessel belongs; but, in case there shall be no seamen's hospital there for the benefit of the old and disabled seamen of the same port and their families, to be distributed by the persons having the direction of the merchant-seamen's fund at such port; or, in case there shall be no establishment there, by the magistrate or overseer of the poor of such port; and the other third part thereof to and for the person who shall sue for the same.

10. *Exemption of certain cases.* Nothing in this act shall extend to any agreement made with any seaman, &c., hired in the West Indies, who shall, at the time of such hiring, deliver to the master of such merchant-vessel a certificate, under the hand of the master of the vessel on board of which such seaman, &c., had then last served, signed in the presence of one witness or more, stating their usual place of abode, and thereby certifying that such seaman, &c., had been duly discharged from the vessel on board which he had so last served; and which certificate the said master shall grant within three days next after application made to him by such seaman, &c., before a witness; or, in default thereof, shall forfeit twenty pounds. Nor shall this act extend to any agreement to be made with any person hired or engaged to serve on board any merchant-vessel, which, through necessity, or on account of any hazardous service or extraordinary duty, require such agreement to be made, and more wages given, and of which proof shall be made on oath before the chief magistrate or principal officer of any port or place, or before any justice of the peace of the said colonies or plantations; and provided also, that such person so hired shall not have deserted from the vessel on

board of which he had then last served; and provided also, that no greater wages shall be given or received, except in case of such necessity, very hazardous service, or extraordinary duty as aforesaid, then after the rate of double the monthly wages, or the wages to be settled by any governor, chief magistrate, collector, or comptroller, as hereinbefore directed.

11. *Articles to be entered into.* From the 1st of July, 1797, the articles to be entered into by and between the masters, seamen, and mariners, of such merchant-ships, shall be agreeable to the purport and effect prescribed by the statute, for which, see the schedule thereto annexed.

The 45 Geo. 3. c. 81. is an act to amend the 31 Geo. 3. c. 39., respecting the agreements of seamen, and enacts, that if any seaman, after he shall have entered into any agreement as mentioned in the said act, shall neglect or refuse to proceed on the voyage in pursuance of the same, on the complaint of the master or commander, or owner, to a justice of the peace, he shall on conviction be imprisoned and kept to hard labour for not more than 30, nor less than 14, days.

The most recent statute on the subject of seamen is the 58 Geo. 3. c. 38. It first recites the 11 & 12 W. 3. c. 7., by which statute, masters of merchant-vessels are punishable by three months' imprisonment for leaving any of his ship's crew in any foreign country, being able and willing to return home; and directs that the mode of convicting such offenders shall be by indictment in the court of King's Bench at Westminster, which court may issue commissions to take evidence on the subject in other countries. It next notices an omission in 31 Geo. 3. c. 10., and inflicts a penalty of 100*l.* on any master of a merchant-vessel, who shall refuse to take on board, and bring home any seafaring-man, or boy, a subject of Great Britain, left behind in any foreign country, being required so to do by the proper authorities, to be recovered by information in the said court of K. B. and with like power of issuing commissions. It next provides regulations to be observed by masters of vessels leaving seafaring-men, or boys, at any foreign port or place on account of sickness; and lastly inflicts a penalty of 20*l.* on every master of a vessel, who, having left such seafaring-man, or boy, at any such foreign port, &c., neglect or refuse to deliver an account of wages due, and to pay the amount of the same, to be recovered by action or information in K. B. with full costs of suit, and with like powers respecting the obtaining of evidence &c.

By various statutes, the last of which is 56 Geo. 3. c. 67., sailors having served the king for a limited time, are free to use any trade, or profession, in any town, except in Oxford or Cambridge.

SEAM, or *Seme of corn*, is a measure of eight bushels.

SEAM of glass, the quantity of 120 pounds, or 24 stones, each five pounds weight. The seam of wood is a horse-load.

SEAMS of a ship, are places where her planks meet, and join together. There is also a kind of peculiar seam in the sewing of sails, which they call monk-seam; the other seam of a sail is the round seam, so called from its being round like the common seams.

SEA-ONION. See SQUILL.

SEA-WORTHY. A ship is said to be sea-worthy, when she is in every respect fitted for her destined voyage.

Every ship assured must, at the time of the assurance, be able to perform the voyage, unless some external accident should happen; and, if she have a latent defect, though wholly unknown to the parties, that will vacate the contract; and the assurers are discharged. This doctrine is founded upon that general principle of assurance-law, that the assurers shall not be responsible for any loss arising from the insufficient or defective quality or condition of the thing assured.

But, although the assured ought to know whether the ship was sea-worthy or not at the time she set out upon her voyage, yet he may not be able to know the condition she may be in after she is out a twelvemonth; and, therefore, whenever it can be made appear, the decay to which the loss is attributable did not commence till a period subsequent to the assurance, as she was sea-worthy at the time, the underwriter would be liable. In the case, *Eden v. Parkinson*, Doug. 708, the same principle was much relied upon. Lord Mansfield said, "By an implied warranty, every ship assured must be right, staunch, and strong; but it is sufficient if she be so at the time of her sailing. She may cease to be so in twenty-four hours after departure, and yet the underwriter will continue liable. — Every case of this kind, it is true, must depend upon its own circumstances; but, when they are once ascertained, the rule of law is clear and decisive." So in *Arman v. Woodman*, 5 Taunt. 299.

Sea-worthiness being an implied condition, in the contract of assurance, it is not necessary there should be any previous representation of the condition of the ship, unless particularly called for, because, unless it be fit for the performance of the voyage assured, there is no binding contract. — *Shulbred v. Nutt*; sittings at Guildhall after Hilary, 1782. — *Haywood and another v. Rodger*, 4 E. R. 490.

It is also an implied condition, that the ship should be furnished with every thing necessary for the purpose of safe and careful navigation. She must have a sufficient crew, a captain of competent skill, and a pilot on board, wherever a pilot is custom-

arily employed. — *Law v. Hollingworth*, 7. Term Rep. 160. So, also, she must be furnished with sufficient tackling. See INSURANCE.

But as a full complement of men is not necessary in harbour, she does not cease to be sea-worthy for want of a crew, till she sails on a voyage without a crew. *Arman v. Woodman*, 5 Taunt. 299.

A neutral vessel is not sea-worthy, unless she be provided with documents to show her neutrality. *Steel v. Lacy*, 5 Taunt. 285.

The ship *Indian* sailed from Liverpool to the coast of Africa, and thence to the West Indies and America. She arrived at Demerara a mere wreck, owing to a concussion resembling an earthquake, and foundered before she reached shore: The slaves were profitably sold: and the plaintiff recovered, as for a total loss. — A rule was obtained, calling on the plaintiff to show cause, why a new trial should not be had, on the grounds that the subject-matter of the assurance was considerably deteriorated on the ship's arrival. It was, however, held that this argument was of no weight, and the rule was discharged. — *Shawe v. Felton*. 2 E. R. 109.

SEARCHER, an officer of the customs, whose business is to search and examine all ships outward-bound, to see whether they have any prohibited or unaccustomed goods on board.

SEASIN, or SEASING, in a ship, the name of a rope, by which the boat rides by the ship's side when in the harbour, &c.

SEBESTINES, (GER. *Sebesten*, *Schwarze Brustbeeren*. DU. *Zwarte borstbessen*, *Borstpruimen*, *Sebesten*. DA. and SW. *Sebesten*. FR. *Sebestes*. IT. *Sebesten*, *Sebesto*. SP. *Sebesto*, *Sebestes*. PORT. *Fruta d'entrudo*. RUS. *Sebasteny*, *Slivki iedwabne*. LAT. *Sebestena*.) a sort of fruit of a dark green colour, approaching to black, somewhat similar to the small Damascan plum, except that the kernel is of a triangular form. It comes to us from the Levant, and is used for medicinal purposes.

SEED-LAC, (GER. *Saamenlack*, *Körn-erlack*. DU. *Zaadlak*. DA. *Sædlak*. SW. *Sådeslack*. FR. *Lacque en graine*. IT. *Lacca in grana*. SP. *Laca en granos*. PORT. *Laca ern grãos*. LAT. *Lacca in granis*.) is nothing more than STICK-LAC, (which see,) separated from the adhering sticks, and grossly powdered. It is employed for the same purposes as the other lacs.

SEED-PEARL. See PEARL, and PEARL-SEED.

SEEDS, that product of all vegetables by which their respective species are propagated. Its general acceptance, as a commercial term, is confined to some particular descriptions of seed which we are in the continual practice of importing, especially clover-seed, and rape-seed: see those titles.

The 30 Geo. 3. c. 41. regulates the duty to be paid on the importation of rape-seed

from America; and 35 Geo. 3. c. 117., continued by 49 Geo. 3. c. 20., prescribes rules for the warehousing and bonding rape-seed, clover-seed, &c. imported from America, Ireland, and other countries.

SEEDSMAN. This shopkeeper sells all sorts of garden and grass seeds, gardeners' tools, mats, &c. Most of the opulent London seedsmen have nurseries in the environs of the metropolis, where they rear fruit-trees, and plants of nearly every description, and grow a great part of the seeds which they sell in their shops. They, however, likewise import garden-seeds from Holland, and other parts of Europe, and the wholesale dealers in seeds export clover, trefoil, and garden-seeds, as well as split-peas, &c. to a large amount to Ireland.

SEELING, at sea, is used in the same sense nearly with heeling: when a ship lies down constantly, or steadily on one side, the seamen say, she heels; and they call it seeling when she tumbles violently, and suddenly, by the sea forsaking her, as they call it, that is, the waves leaving her for a time in a bowling sea.

SEELITE, the name given by Dr. Clarke to a red siliceous stone, lately brought to this country from Gryphylta in Sweden. It is described by some of the Swedish chemists, as a pure hydrate of silica, of the same nature as opal. It is of a red colour, possessing no more lustre and transparency than horn. Its fracture resembles that of flint, which it equals in hardness: its specific gravity is 2.71. Its chemical constituents are silica, alumina, manganese, and water.

SEIGNORAGE, signifies the right, or due belonging to a seigneur, or lord; but it is particularly used for a duty belonging to the prince, for the coining of money, called also coinage; which under our ancient kings was five shillings for every pound of gold brought in the mass to be coined, and a shilling for every pound weight of silver. At present the king claims no seignorage at all, but the subject has his money coined at the public expense; nor has the king any advantage, but what he has from the alloy. See COINING.

SEIZE, in the sea-language, is to make fast, or bind, particularly to fasten two ropes together, with rope-yarn. The seizing of a boat is a rope tied to a ring, or little chain, in the foreship of the boat, by which means it is fastened to the side of the ship.

SEIZURE, an arrest of some merchandise, moveable, or other matter, either in consequence of some law, or of some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure. In seizures, among us, one-half generally goes to the informer, and the other half to the king. See CUSTOMS, EXCISE, and SMUGGLING.

The principal statutes which relate to seizures, are, 5 Geo. 2. c. 11. — 6 Geo. 1. c. 2. — 8 Geo. 1. c. 18. — 11 Geo. 1. c. 30. — 9 Geo. 2. c. 35. — 21 Geo. 3. c. 59. — 24 Geo. 3. c. 47. — 27 Geo. 3. c. 52. — 45 Geo. 3. c. 121. — 47 Geo. 3. c. 66. — 49 Geo. 3. c. 65. — 51 Geo. 3. c. 96. — 54 Geo. 3. c. 171. — 57 Geo. 3. c. 87. — 58 Geo. 3. c. 76.

SELENITE, in mineralogy, crystallized gypsum. See that title.

SELENIUM, a metallic substance, lately discovered by Berzelius, the Swedish chemist, in the pyrites from the mine of Fahlun in Sweden. In the state of an oxide, in which form it is obtained, it is, when viewed in a mass, of a grey colour, with a brilliant metallic lustre; its fracture is vitreous, like that of sulphur, and displays a reddish tinge. The specific gravity is 4.6. In hardness and friability, it is nearly similar to sulphur. It may be reduced by trituration into a red powder, with particles having a metallic lustre. It becomes soft at the temperature of boiling water, and melts at a higher degree of heat. During cooling, it preserves, for some time, a degree of fluidity, like sulphur, or Spanish wax; so that it may be moulded between the fingers, and drawn into threads of a brilliant metallic lustre, which, by transmitted light, are of a deep-red colour. In a still higher degree of heat, it sublimes in opaque metallic globules. Distilled in a long-necked retort, it sublimes in flowers of a beautiful vermilion colour. Selenium has not yet been employed in the arts; but from its physical properties above enumerated, it is evident that it may be applied to many useful purposes.

SELTZER WATER, a mineral water, which springs up at Lower Seltzer, a village about ten miles from Frankfort on the Maine. This is a medicinal water, which was formerly imported in considerable quantities; but at present, almost all that is drunk in Great Britain, is artificial. This is more pleasant to the taste than the natural Seltzer water, as the saline particles, of a disagreeable flavour, and which contribute nothing to its medicinal virtue, are left out of the composition. It is likewise considerably stronger. It is made by adding one scruple of *magnesia alba*, six scruples of fossil alkali, and four scruples of common salt, to each gallon of water, and saturating the water with fixed air, by means of one of the common glass-machines.

SENA, or **SENNÀ**, (GER. *Senesblätter*. DU. *Senne*. DA. *Sensblade*. SW. *Sennesblader*. FR. *Séné*. IT. *Sena*. SP. *Sen*, *Sena*. PORT. *Sene*, *Senna*. RUS. *Senetnie listii*. POL. *Senes*. LAT. *Senna*, *Sennae folia*.) The leaf of the *cassia senna*, Linn. This is a shrubby plant, cultivated in Persia, Syria, and Arabia; whence the leaves are brought, dried, and picked from the stalks, to Alexandria, in Egypt, and thence imported into Europe. They are of an oblong figure,

sharp-pointed at the ends, about a quarter of an inch broad, and not a full inch in length; of a lively yellowish-green colour, a faint, not very disagreeable smell, and a nauseous taste. Some inferior sorts are brought from Tripoli, and other places; these may easily be distinguished by their being either narrower, longer, and sharper-pointed; or larger, broader, and round-pointed, with small prominent veins; or large and obtuse, of a fresh green colour, without any yellow cast.

The Arabians sell their senna at Mecca and Jidda, whence it passes by way of Suez and Kahira, to Alexandria.

The senna Italica, or blunt-leaved senna, is a variety of the Alexandrian species, which by its cultivation in the south of France, has been found to assume this change. It is less purgative than the pointed-leaved senna. Senna, in medicine, is a very useful cathartic.

SENEGAL, or SENECA GUM. *See* GUM-SENEGAL.

SEQUIN, ZECHIN, or CHEQUIN, a Venetian golden coin, worth 9s. 2d.; at Rome it passes for 9s. There is a golden sequin current in Barbary at 8s. 4d. The silver sequin passes in Barbary at 3s. 4d. and there is also a silver sequin in Arabia, worth 7s. 6d. sterling.

SERGE, (GER. *Sarsche*. DU. *Sargie*. DA. *Sars*, *Sarge*, *Sirts*. SW. *Sars*. FR. *Sarge*, *Serge*. IT. *Sargia*. SP. *Sarga*. PORT. *Sarja*. RUS. *Ssarsha*. POL. *Szarozza*.) a woollen stuff manufactured in a loom, of which there are various kinds, denominated either from their different qualities, or from the places where they are wrought; the most considerable of which is the London serge, which is highly valued abroad.

In the manufacture of London serges, the longest wool is chosen for the warp, and the shortest for the woof. But before either kind is used, it is first scoured, by putting it in a copper of liquor, somewhat more than luke-warm, composed of three parts of fair water, and one of urine. After it has staid in it long enough for the liquor to take off the grease, &c it is stirred briskly about with a wooden peel, taken out, drained, washed in a running water, and dried in the shade; beaten with sticks on a wooden rack, to drive out the coarser dust and filth, and then picked clean with the hands. It is then greased with oil of olives; and the longest wool combed with large combs, heated in a little furnace for that purpose; to clear it from the oil, it is put into a vessel of hot soap-water, whence being taken out, wrung, and dried, it is spun on the wheel. As to the shorter wool, intended for the woof, it is only carded on the knee, with small fine cards, and then spun on the wheel, without being scoured of its oil: and here it is to be observed, that the thread for the warp is al-

ways to be spun finer, and much better twisted, than that of the woof.

The wool both for the warp, and woof, being spun, and the thread reeled into skains, that of the woof is put on spools, fit for the cavity of the shuttle; and that for the warp is wound on a kind of wooden bobbins, to fit it for warping; and when warped, it is stiffened with a size, usually made of the shreds of parchment; and when dried, put into the loom, and mounted so as to be raised by four treadles, placed under the loom, which the workman makes to act transversely, equally, and alternately, one after another, with his feet; and as the threads are raised, throws the shuttle. *See* WEAVING.

The serge, on being taken from the loom, is carried to the fuller, who fulls or scours it, in the trough of his mill, with fullers'-earth; and after the first fulling, the knots, ends, straws, &c. sticking out on either side of the surface, are taken off with a kind of pliers or iron pincers, after which it is returned into the fulling-trough, where it is worked with warm water, in which soap has been dissolved; when quite cleared, it is taken out, the knots are again pulled off; it is then put on the tenter to dry; taking care, as fast as it dries, to stretch it out, both in length and breadth, till it is brought to its just dimensions; then being taken off the tenter, it is dyed, shorn, and pressed.

SERON of almonds, is the quantity of two hundred weight; of indigo, the same; of aniseed from three, to four, hundred; of Castile soap, from two hundred and a half, to three hundred and three quarters.

SERVANTS. *See* title MASTER.

SESTE, a measure for corn, &c. *See* SAT.

SETTING, in the sea-language. To set the land, or the sun, by the compass, is to observe how the land bears on any point of the compass, or on what point of the compass the sun is. Also when two ships sail in sight of one another, to mark on what point the chased bears, is termed setting the chase by the compass.

SET-OFF AND MUTUAL DEBTS.

Where tradesmen are mutually indebted, one debt may be set against the other; and in case any action be brought, notice of the particular sum or debt so intended to be insisted upon, and upon what account it became due, must be given, otherwise it shall not be allowed in evidence upon the general issue.

Debts of a different nature may not be set off, as bond debts against simple contracts, &c. The debts intended to be set off, may be either pleaded in bar, or be given in evidence, with notice under the general issue, unless such debts shall accrue by reason of any penalty, in which judgment in such action shall be entered up for no more than shall be justly due.

The actions for which a set-off is allowed,

are *debt, covenant, and assumpsit* for the non-payment of money; and the demand intended to be set off must be liquidated, or capable of being certainly ascertained, and such as might have been made the subject of one of these actions.

In cases of bankruptcy, the defendant may set off a debt due to him at the time of the bankruptcy, but he cannot set off a note given to him afterwards; nor can he set off cash-notes issued by the bankrupt before his bankruptcy, and payable to bearer, unless the defendant show further, that such notes came to his hands before the bankruptcy.

Where, at the time of action brought, a larger sum was due from the plaintiff to the defendant than from the latter to the former, the set-off should be pleaded; but where the sum is less, it is more proper to give a notice.

A set-off reducing the plaintiff's original demand under 40s. does not affect the jurisdiction of a superior court; so if plaintiff recover 1s. damages, where there is a set-off, he must have costs.

The notice of set-off is usually written underneath the plea, and delivered with it to the plaintiff's attorney, a copy of which should be made; because, upon the trial of the cause, it becomes proper to produce such notice.

SEXLING, an imaginary money of Germany, equivalent to 5-64ths of a penny sterling.

SHAG, (GER. *Plüsch*. DU. *Tryp*. DA. *Plys*, *Plyds*. SW. *Plys*, *Schagg*. FR. *Peluche*, *Panne*. IT. *Felpa*, *Peluzzo*. SP. *Felpa*. PORT. *Pelucia*, *Pelucia*, *Felpa*. RUS. *Plisch*. POL. *Plisz*, *Plisnia*.) a sort of woollen stuff, smooth on one side, and velvety on the other. Shags are usually made from coarse wools, but there are some remarkably fine, which latter are used for waistcoating of the best kind. The coarser shags are employed as different parts of wearing apparel by the lower orders of the people. These articles are manufactured in abundance in Yorkshire, and some other parts of this kingdom, and are exported hence to the northern parts of Europe, to Ireland, and to North America.

SHAGRIN, or **CHAGREEN**, (GER. *Schagrin*. DU. *Segryn*. DA. *Chagrain*. SW. and FR. *Chagrin*. IT. *Zigrino*. *Sagrino*. SR. *Zapa*. PORT. *Liza*. RUS. *Schagrim*, *Schagren*. POL. *Cupa*.) a kind of grained leather, prepared, as is supposed, of the skin of a species of squalus, or hound-fish, called the shagreen, or shagrain, and much used in covering cases, books, &c.

It is imported from Constantinople, Tunis, Tripoli, Algiers, and from some parts of Poland, where it is prepared in the following manner: the skin being stretched out is first covered over with mustard-seed, which is bruised upon it; and being thus exposed to the weather for some days, it is then tanned.

are *debt, covenant, and assumpsit* for the non-payment of money; and the demand intended to be set off must be liquidated, or capable of being certainly ascertained, and such as might have been made the subject of one of these actions.

In cases of bankruptcy, the defendant may set off a debt due to him at the time of the bankruptcy, and even a mutual credit, but he cannot set off a note given to him afterwards; nor can he set off cash-notes issued by the bankrupt before his bankruptcy, and payable to bearer, unless he show that such notes came to his hands before the bankruptcy.

It is not unusual, even in Turkey, to prepare a species of shagrin from the hides of horses, asses, and mules. This sort of shagrin is frequently prepared in Poland, but the article is too dry, and is seldom, if ever, well dyed.

SHAKLES, in a ship, are the rings with which the ports are shut fast, by lashing the port-bar to them. There are also shakles put upon bilbow-bolts, for confining the men who have deserved corporal punishment.

SHALE, a mineral that occurs among coal, and appears to be a mixture of clay and bitumen. It is in masses of a brownish black colour, has a straight slaty fracture. It emits a pale flame, and burns white.

SHALLOON, a slight woollen stuff, being a species of serge. It derives its appellation from the town of Chalons, in France, where the first specimens of the article were produced. At the present day, abundance of shalloons are manufactured in Northamptonshire, and other parts of England, as well as at Edinburgh. The Scotch shalloons are of peculiarly excellent quality. Shalloons are exported to Ireland, the North of Europe, and America.

SHALLOP, so called from the French *chaloupe*, is one of the boats belonging to a ship. It is particularly adapted for sailing in shoal water, and is therefore extremely useful in dangerous roads, &c.

SHAMBLES, among miners, a sort of niches, or landing-places, left at such distances in the adits of mines, that the shovelmen may conveniently throw up the ore from shamble to shamble, till it comes to the top of the mine.

SHAMMY, or **CHAMOIS LEATHER**, (GER. *Sämischleder*. DU. *Zeem*, *Zeemleër*. DA. *Semslæder*. SW. *Sämiskläder*. FR. *Chamois*. IT. *Camoscio*. SP. *Gamioza*. PORT. *Camurça*. RUS. *Samschanüi*, *Koshi*. POL. *Zamess*, *Lesz*.) a kind of leather dressed either in oil, or tanned, and much esteemed for its softness, pliancy, and being capable of bearing soap without hurt.

The real shammy is prepared of the skin of the chamois-goat.

The true chamois leather is counterfeited with common goat, kid, and even sheepskin; the practice of which makes a particular profession, called by the French *cha-*

moisure. The last is the least esteemed, yet so popular, and such vast quantities prepared, especially about Orleans, Marseilles, and Tholouse, that it may not be amiss to give the method of preparation.

The manner of chamoising, or of preparing sheep, goat, or kid-skins in oil, in imitation of chamois :

The skins being washed, drained, and smeared over with quick-lime, on the fleshy side, are folded in two, lengthwise, the wool outwards, and laid on heaps, and so left to ferment eight days ; or if they had been left to dry after flaying, for fifteen days.

Then they are washed out, drained, and half-dried, laid on a wooden leg or horse, the wool stripped off with a round staff for the purpose, and laid in a weak pit, the lime whereof had been used before, and had lost the greatest part of its force.

After twenty-four hours they are taken out, and left to drain twenty-four more ; then put into another strong pit. This done, they are taken out, drained, and put in again by turns ; which begins to dispose them to take oil ; and this practice they continue for six weeks in summer, or three months in winter ; at the end whereof they are washed out, laid on the wooden leg, and the surface of the skin on the wool side peeled off, to render them the softer ; then made into parcels, steeped a night in the river, in winter more ; stretched six, or seven, over one another on the wooden leg ; and the knife passed strongly on the fleshy side, to take off any thing superfluous, and render the skin smooth.

Then they are stretched, as before, in the river, and the same operation repeated on the wool side ; then thrown into a tub of water with bran in it, which is brewed among the skins till the greatest part sticks to them ; and then separated into distinct tubs, till they swell, and rise of themselves, above the water.

By these means, the remains of the lime are cleared out ; they are then wrung out, hung up to dry on ropes, and sent to the mill, with the quantity of oil necessary to fill them : the best oil is that of stock-fish.

Here they are first thrown in bundles into the river for twelve hours, then laid in the mill-trough, and fulled without oil, till they are well softened ; then oiled with the hand, one by one, and thus formed into parcels of four skins each, which are milled, and dried on cords a second time, then a third ; then oiled again, and dried.

This process is repeated as often as necessity requires ; when done, if there is any moisture remaining, they are dried in a stove, and made up in parcels wrapped up in wool ; after some time they are opened to the air, but wrapped up again as before, till such time as the oil seems to have lost all its force, which it ordinarily does in twenty-four hours.

The skins are then returned from the mill to the chamoiser, to be scoured ; which is done by putting them into a lixivium of wood-ashes, working and beating them in it with poles, and leaving them to steep till the lye has had its effect ; then wrung out, steeped in another lixivium, wrung again, and this repeated till the grease and oil are purged out. They are then half dried, and passed over a sharp-edged iron instrument, placed perpendicularly in a block, which opens, softens, and makes them gentle : lastly, they are thoroughly dried, and passed over the same instrument again, which finishes the preparation, and leaves them in form of chamois.

Kid, and goat-skins, are chamoised in the same manner as those of sheep, excepting that the hair is taken off without the use of any lime ; and that when brought from the mill they undergo a particular preparation called ramalling, the most delicate, and difficult, of all.

It consists in this, that as soon as brought from the mill they are steeped in a fit lixivium ; taken out, stretched on a round wooden leg, and the hair scraped off with the knife ; this makes them smooth, and in working cast a fine nap. The difficulty is in scraping them evenly.

The animal called the chamois, which yields the true skin, is extremely timid, and abounds in the department of the Isère, in France, as also in the Alpine and the Pyrenean mountains. The greater part of the real shammy-skins is prepared with oil, &c. in the towns of Grenoble, Geneva, Chambery, &c.

SHARPING-CORN, a customary gift of corn, said to be half a bushel for a ploughland, which the farmers pay in some parts of England to their smith, every Christmas, for sharpening their plough-irons, harrow-tines, &c.

SHAWLS, (*GER. Schalen. DU. Shawls. DA. Shawles. SW. Shawlar. FR. Chals, Chales, Shals. IT. Shavali. SP. Schavalos. PORT. Chales. POL. Schawales,*) a species of fine woollen handkerchief, forming an article of female dress.

The finest shawls are imported from the East Indies, where they are highly esteemed, and cost from fifty, to two hundred, guineas each ; John Philip Knight, an ingenious manufacturer of Norwich, invented a method of making shawls, for which, in 1792, the Society for the Encouragement of Arts, &c. conferred on him their silver medal. The shawls of this manufacture are inferior only to those of India, though they are sold at one-twentieth part of the price. They are now made in Edinburgh to a large extent, and in several other places.

Cachemire, or Kosmir, a province in the late territories of the Great Mogul, is the grand seat of the manufacture of those beautiful shawls, which bear the name of this

province. Not only men and women, but children of an extremely tender age, are engaged in this fabric. The Cachemire shawls are usually made in pieces of a yard and a half long, and half a yard in breadth, and are embroidered, in the working, at each end. The Moguls, and the generality of the Orientals, as well male, as female, wear them on their heads during winter, rolled up in turban fashion, one end falling long, and gracefully, over the left shoulder. These shawls are of two sorts: those of the first sort are made from the wool of the country, which is finer than that of Spain; and those of the second sort from the wool, or rather hair, taken from the breasts of the wild goats, which inhabit Great Thibet. This kind of hair is called *town*. The shawls of the second sort are much dearer than those of the first, no beaver being more delicate than they are; but the greatest care must be taken to open and air them frequently, as otherwise they will become a prey to worms. The Omrahz have some made on purpose, which cost 150 rupees, whereas those made from the wool of the country seldom sell at more than 50 rupees. Speaking of the shawls made in Patna, Agra, and Cahor, Bernier says, that the artisans of those places are unable to give their shawls that softness, and beauty of appearance, that we so much admire in those of Cachemire, perfections which he attributes to the peculiar quality of the water in the latter province. At Seringar, in Cachemire, there are above two thousand manufactories, in which the different processes of weaving, and dyeing, the shawls are constantly practised. The merchants of the country annually journey from mountain to mountain, for the purpose of buying up wools for the use of the manufacturers.

We procure the greater part of the Cachemire shawls used in this country, from Surat, where it is said a vast number of them are made from the Cachemire wool itself.

In Russia also are made shawls of very excellent quality, called Moscow-shawls.

SHEARS, (GER. *Grosse Scheeren*. DU. *Groote schaaren*. DA. *Store saxer*. SW. *Stora saxar*. FR. *Forces*. IT. *Forbici*, *Cesoje*. SP. *Tijeras*. PORT. *Tesouras*.) an appellation bestowed generally upon the largest sort of scissars, though, properly speaking, it is only applicable to the instruments used by sheep-shearers, clothiers, bookbinders, &c. The best shears are those made at Sheffield.

SHEATHING, in the sea-language, is the casing that part of a ship which is to be under water. This is done with fir-board of an inch thick; first laying hair and tar, mixed together, under the boards, and then nailing them on, in order to prevent worms from eating the ship's bottom. It is also usual to denominate the casing formed of copper (with which the bottoms of the West India ships, &c. are protected) by the same appellation.

SHEATS, in a ship, are ropes bent to the clews of the sails; serving in the lower sails to haul aft the clews of the sail; but in top-sails, they serve to haul home the clew of the sail, close to the yard-arm.

SHEEP. (GER. *Schafe*. DU. *Schaapen*. DA. *Faar*. SW. *Får*. FR. *Brebis*, *Bêtes à laine*, *Moutons*. IT. *Pecore*. SP. *Pecora*, *Ganado lanar*, *Ovejas*. PORT. *Gado ovelhum*, *Ovelhas*. RUS. *Owzi*. POL. *Owce*, *Stalek*. LAT. *Oves*.) These well known and useful animals are, in more than one respect, of great importance to the trading part of the community, as well as to society in general. Their wool, skins, and flesh, and even their guts, constitute articles of most extensive traffic.

Of all the countries of Europe, Spain is most abundant in sheep, for clothiers' wool; but the English breeds of sheep have of late years undergone astonishing improvements, insomuch that the wool of some of them, is little, if at all, inferior to the best Segovian. See articles AGRICULTURE, ENGLAND, in articles EUROPE, and WOOL.

Sheep-skins, when dressed in the ordinary way, are used by glovers, breeches-makers, book-binders, &c.

The string generally called catgut, is, in part, the guts of sheep. Nor is any part of their carcase useless; for even their feet are dressed and sold under the name of *sheep's trotters*.

SHEERING, or **SHEARING**, in the woollen manufacture, is the cutting off, with large shears, the too long nap, in order to make the cloth more smooth and even.

SHEERING, in the sea language. When a ship is not steered steadily, they say "she sheers," or "goes sheering," or, when at anchor, she goes in and out by means of the current of the tide, they also say, "she sheers."

SHEERS, in a ship, are two masts set across at the upper end of each other; a contrivance generally used for setting, or taking out, the masts of a ship, where there is no hulk to do that office.

SHEET ANCHOR, in a ship, is the largest anchor; which, in stress of weather, is the mariner's last refuge, when an uncommonly stiff gale of wind happens.

SHELF, among miners, the same with what they otherwise call *fast ground*, or *fast country*; being that part of the internal structure of the earth, which they find lying even, and in an orderly manner, and evidently having retained its primitive form and situation, unmoved by the waters of the general deluge, while the circumjacent and upper strata have been evidently disturbed.

SHELLAC, or **SHEL-LAC**, (GER. *Schellack*. DU. *Schellak*. DA. *Skallak*. SW. *Skällak*. FR. *Lacque en feuilles*. IT. *Lacca piana*. SP. *Laca en tabillas*. PORT. *Laca en folhas*. LAT. *Lacca in tabulis*.) the species of lac which has undergone a simple

purification, in the following manner: The common lac is broken into small pieces, and put into a canvas bag of about four feet long, and not above six inches in circumference. Two of these bags are in constant use, and each of them is held by two men. The bag is placed over the fire, and frequently turned, till the lac is liquid enough to pass through its pores; when it is taken off the fire, and twisted in different directions by the men who hold it, at the same time dragging it along the convex part of a plantain-tree prepared for this purpose; and while this is doing, the other bag is heating to be treated in the same way. By this process the lac is formed into thin transparent laminæ, which pass under the name of shell-lac. See LAC.

SHEŁON, a copper money of Poland and Prussia, equivalent to 7-45ths of a penny sterling.

SHERRY, a sort of Spanish wine, made in the vicinity of Xeres, a town of Andalusia, whence it receives its name, for Sherry is said to be a mere corruption of Xeres. There are not only dry, but sweet sherries; but the dry, however, are the most esteemed, more particularly when the face presents a pale straw-colour. There is something in its flavour, which partakes of the taste of leather. This is owing to the custom of bringing the wines down the country in large leather vessels, or, as the Spaniards call them, *botts*, whence we derive the term *butts*, which we bestow upon the casks in which we receive the wine. This flavour goes off with keeping; wherefore it is that no wine of this kind can be palatable till it be of a considerable age. The Sherry-wines are shipped for the most part at Cadiz; and are principally exported to England.

SHILLING, a silver coin, current in this country at twelve, and in Ireland at thirteen, pence. There is an imaginary money of the British West Indies, called a Shilling, which is reckoned at 8½*d* sterling.

SHINGLES, in building, are small pieces of wood, or quartered oaken boards, sawn to a certain scantling, or, as is more usual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long.

Shingles are also used instead of tiles or slates, especially for churches or steeples; however, this covering is *de r*; yet where tiles are very scarce, and a light covering required, it is preferable to thatch; and where the shingles are made of good oak, cleft, and not sawed, and well seasoned in water and the sun, they make a sure, light, and durable, covering. The building is first to be covered all over with boards, and the shingles nailed upon them. Vast quantities of this article are annually exported from North America to the West Indies. See AMERICA.

SHIP, a general name for all large vessels, particularly those equipped with three

masts and a bow-sprit; the masts being composed of a lower-mast, top-mast, and top-gallant mast: each of these being provided with yards, sails, &c.

SHIP, *of War*, is a vessel properly equipped with artillery, ammunition, and all the necessary martial weapons and instruments for attack or defence. They are distinguished from each other by their several ranks or rates, a specification of which will be found under the article RATE. Ships of war are fitted out either at the expense of the state, or by individuals. Those fitted out by the state are called king's ships, and are divided into ships of the line, frigates, sloops, &c. Ships of war fitted out by individuals are called privateers.

SHIP, *Hospital*, a vessel fitted up to attend on a fleet of men of war, and receive their sick, or wounded; for which purpose her decks should be high, and her ports sufficiently large. Her cables ought also to run upon the upper deck, to the end that the beds or cradles may be more commodiously placed between decks, and admit a free passage of the air to disperse that which is offensive or corrupted.

SHIP, *Merchant*, a vessel employed in commerce to carry commodities of various sorts from one port to another. The largest merchant-ships are those employed by the different companies of merchants who trade to the East Indies. They are in general larger than our 40-gun ships, and are commonly mounted with 20 guns on their upper-deck, which are nine-pounders; and six on their quarter-deck, which are six-pounders.

SHIP, *Store*, a vessel employed to carry artillery or naval stores for the use of a fleet, fortress, or garrison.

SHIP, *Transport*, is generally used to conduct troops from one place to another.

Besides the different kinds of ships above-mentioned, which are denominated from the purpose for which they are employed, vessels have also, in general, been named according to the different manner of rigging them. It would be an endless, and at the same time an unnecessary, task, to enumerate all the different kinds of vessels with respect to their rigging.

To *ship*, is either used actively, as to embark any person, or put any thing aboard ship; or passively, to put any thing into a ship; as, "we shipped a heavy sea at three o'clock in the morning."

To *ship*, also implies to fix any thing in its place; as, to ship the oars, that is, to put them in their rowlocks; to ship the swivel guns, is to fix them in their sockets: to ship the handspokes, &c.

Management of ships at single anchor, is the method of taking care of a ship while riding at single anchor in a tide-way, by preventing her from fouling her anchor, &c.

The following rules for this purpose will be found of the utmost consequence :

Riding in a tide-way, with a fresh of wind, the ship should have what is called a short or windward-service, say 45 or 50 fathoms of cable, and always sheered to windward, not always with the helm hard down, but more, or less, so according to the strength or weakness of the tide. It is a known fact, that many ships sheer their anchors home, drive on board of other ships, and on the sands near which they rode, before it has been discovered that the anchor had been moved from the place where it was let go.

When the wind is cross, or nearly cross, off shore, or in the opposite direction, ships will always back. This is done by the mizen-topsail, assisted, if needful, by the mizen-staysail; such as have no mizen-topsail commonly use the main-topsail, or if it blows fresh, a top-gallant sail, or any such sail at the gaff.

In backing, a ship should always wind with a tawt cable, that it may be certain the anchor is drawn round. In case there is not a sufficiency of wind for that purpose, the ship should be hove apeak.

Riding with the wind afore the beam, the yards should be braced forward; if abaft the beam, they are to be braced all aback.

If the wind is so far aft, that the ship will not back (which should not be attempted if, when the tide eases, the ship forges ahead, and brings the buoy on the lee quarter), she must be set ahead: if the wind is far aft, and blows fresh, the utmost care and attention are necessary, as ships riding in this situation often break their sheers and come to windward of their anchors again. It should be observed, that when the ship lies in this ticklish situation, the after-yards must be braced forward, and the fore-yards the contrary way; she will lie safe, as the buoy can be kept on the lee quarter; or suppose the helm is a-port, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aft, or nearly so, the starboard main and fore braces should be hauled in. This supposes the main braces to lead forward.

When the ship begins to tend to leeward, and the buoy comes on the weather-quarter, the first thing to be done is to brace about the fore-yard; and when the wind comes near the beam, set the fore-staysail, and keep it standing until it shakes; then brace all the yards sharp forward, especially if it is likely to blow strong.

If lying in the aforesaid position, and she breaks her sheer, brace about the main-yard immediately; if she recovers, and brings the buoy on the lee, or larboard-quarter, let the main-yard be again braced about; but if she comes to a sheer the other way, by bringing the buoy on the other quarter, change the helm, and brace the fore-yard to.

Riding leeward tide with more cable than

the windward service, and expecting the ship will go to windward of her anchor, begin, as soon as the tide eases, to shorten in the cable. This is often hard-work; but it is necessary to be done, otherwise the anchor may be fouled by the great length of cable the ship has to draw round; but even if that could be done, the cable would be damaged against the bows or cut-water. It is to be observed, that when a ship rides windward tide the cable should be cackled from the short service towards the anchor, as far as will prevent the bare part touching the ship.

When the ship tends to windward, and must be set ahead, hoist the fore-staysail as soon as it will stand; and when the buoy comes on the lee quarter, haul down the fore-staysail, brace to the fore-yard, and put the helm a-lee: for till then the helm must be kept a-weather and the yards full.

When the ship rides leeward tide, and the wind increases, care should be taken to give her more cable in time, otherwise the anchor may start, and probably it will be troublesome to get her brought up again; and this care is the more necessary when the ship rides in the hause of another ship. Previous to giving a long service, it is usual to take a weather-bit, that is, a turn of the cable over the windlass end, so that in veering away the ship will be under command. The service ought to be greased, which will prevent its chafing in the hause.

If the gale continue to increase, the top-masts should be struck in time; but the fore-yard should seldom, if ever, be lowered down, that in case of parting, the foresail may be ready to be set. At such times there should be more on deck than the common anchor-watch, that no accident may happen from inattention, or falling asleep.

In a tide-way a second anchor should never be let go but when absolutely necessary; for a ship will sometimes ride easier and safer, especially if the sea runs high, with a very long scope of cable, and one anchor, than with less length, and two cables; however, it is advisable, as a preventive, when ships have not room to drive, and the night is dark, to let fall a second anchor under foot, with a range of cable along the deck. If this is not thought necessary to be done, the deep-sea lead should be thrown overboard, and the line frequently handed by the watch, that they may be assured she rides fast.

SHIP-BUILDING. The pieces by which this complicated machine, a ship, is framed, are joined together in various places, by scarfing, rabbitting, tenanting, and scoring.

During the construction of a ship, she is supported in the dock, or upon a wharf, by a number of solid blocks of timber placed at equal distance from, and parallel to, each other. She is then said to be on the stocks.

The first piece of timber laid upon the

blocks is generally the keel: we say generally, because of late, a different method has been adopted in some of the royal dock-yards, by beginning with the floor timbers; the artists having found that the keel is often apt to rot during the long period of building a large ship of war. The pieces of the keel are scarfed together, and bolted, forming one entire piece, which constitutes the length of the vessel below. At one extremity of the keel is erected the stem. It is a strong piece of timber incurvated nearly into a circular arch, or, according to the technical term, compassing, so as to project outwards at the upper end, forming what is called the rake forward. In small vessels this is framed of one piece; but in large ships it is composed of several pieces scarfed and bolted together. At the other extremity of the keel is elevated the stern-post, which is always of one entire straight piece.

The heel of it is let into a mortoise in the keel, and having its upper end to hang outwards, making an obtuse angle with the keel, like that of the stem: this projection is called the rake abaft. The stern-post, which ought to support the stern, contains the iron-work, or hinges of the rudder, which are called googings, and unites the lower part of the ship's sides abaft.

Towards the upper end of the stern-post, and at right angles with its length, is fixed the middle of the wing-transom, where it is firmly bolted. Under this is placed another piece parallel thereto, and called the deck-transom, upon which the after-end of the lower deck is supported. Parallel to the deck-transom, and at a proper distance under it, another piece is fixed to the stern-post called the first-transom; all of which serve to connect the stern-post to the fashion-pieces. Two more transoms, called second and third, are also placed under these, being likewise attached to the fashion-pieces, into which the extremities of all the transoms are let. The fashion-pieces are formed like the other timbers of the ship, and have their heels resting on the upper part of the keelson, at the after extremity of the floor ribbands.

All these pieces, viz. the transoms, the fashion-pieces, and their top-timbers being strongly united into one frame, are elevated upon the stern-post; and the whole forms the structure of the stern, upon which the galleries and windows, with their ornaments, are afterwards built.

The stem and stern-post being thus elevated upon the keel, to which they are securely connected by knees and arched pieces of timber bolted to both; and the keel being raised at its two extremities by pieces of dead wood, the midship floor timber is placed across the keel, whereto it is bolted through the middle. The floor-timbers before and abaft the midship frame are then stationed in their proper places upon the keel; after

which the keelson, which, like the keel, is composed of several pieces scarfed together, is fixed across the middle of the floor-timbers, to which it is attached by bolts driven through the keel, and clinched on the upper part of the keelson. The futtocks are then raised upon the floor-timbers, and the hawse pieces erected upon the cant-timbers in the fore part of the ship. The top-timbers on each side are next attached to the head of the futtocks, as already explained. The frames of the principal timbers being thus completed, are supported by ribbands.

The ribs of the ship being now stationed, they proceed to fix on the planks, of which the wales are the principal, being much thicker and stronger than the rest. The harpins, which may be considered as a continuation of the wales at their fore ends, are fixed across the hawse pieces, and surround the fore part of the ship. The planks that inclose the ship's sides are then brought about the timbers; and the clamps, which are of equal thickness with the wales, fixed opposite to the wales within the ship: these are used to support the ends of the beams, and accordingly stretch from one end of the ship to the other. The thick-stuff, or strong planks of the bottom within board, are then placed opposite to the several scarfs of the timbers, to reinforce them throughout the ship's length. The planks employed to line the ship, called the ceiling, or foot-waling, is next fixed in the intervals between the thick stuff of the hold. The beams are afterwards laid across the ship to support the decks, and are connected to the side by lodging and hanging knees.

The cable bits being next erected, the carlings, and ledges, are disposed between the beams to strengthen the deck. The waterways are then laid on the ends of the beams throughout the ship's length, and the spricketing fixed close above them. The upper deck is then planked, and the string placed under the gunnel or plansheer in the waist.

They proceed next to plank the quarter-deck and fore-castle, and to fix the partners of the masts and capsterns with the coamings of the hatches. The breast-hooks are then bolted across the stem and bow within-board; the step of the foremast placed on the keelson; and the riders fayed on the inside of the timbers, to reinforce the sides in different places of the ship's length. The pointers, if any, are afterwards fixed across the hold diagonally to support the beams; and the crotchets stationed in the after-hold to unite the half-timbers. The steps of the main-mast and capsterns are next placed; the planks of the lower-decks and orlop laid; the navel-hoods fayed on the hawse-holes; and the knee of the head, or cut-water, connected to the stem. The figure of the head is then erected, and the trail-board and checks are fixed on the sides of the knee.

The taffarel and quarter-pieces, which terminate the ship abaft, the former above, and the latter on each side, are then disposed; and the stern and quarter-galleries framed and supported by their brackets. The pumps, with their well, are next fixed in the hold; the limber-boards laid on each side of the keelson; and the garboard strake fixed on the ship's bottom next to the keel without.

The hull being thus fabricated, they proceed to separate the apartments by bulkheads, or partitions; to frame the portlids; to fix the cat heads and chess-trees; to form the hatchways and scuttles, and fit them with proper covers or gratings. They next fix the ladders whereby to mount or descend the different hatchways; and build the manger on the lower deck, to carry off the water that runs in at the hawse-holes when the ship rides at anchor in a sea. The bread-room and magazines are then lined; and the gunnel, rails, and gangways, fixed on the upper part of the ship. The cleats, kevels, and rand ranges, by which the ropes are fastened, and afterwards bolted or nailed to the sides in different places.

The rudder, being fitted with its irons, is next hung to the stern-post; and the tiller, or bar, by which it is managed, let into a mortoise at its upper end. The scuppers, or leaden tubes, that carry the water off from the decks, are then placed in holes cut through the ship's sides; and the standards bolted to the beams and sides above the decks to which they belong. The poop-lanterns are last fixed upon their cranes over the stern; and the bilge-ways, or cradles, placed under the bottom, to conduct the ship steadily into the water whilst launching.

Stowing and trimming of ships, the method of disposing of the cargo in a proper and judicious manner in the hold of a ship. A ship's sailing, steering, and wearing, and being lively, and comparatively easy at sea in a storm, depend greatly on the cargo, ballast, or other materials, being properly stowed, according to their weight and bulk, and the proportional dimensions of the built of the ship, which may be made too crank or too stiff to pass on the ocean with safety.

These things render this branch of knowledge of such consequence, that rules for it ought to be endeavoured after, if but to prevent, as much as possible, the danger of a ship oversetting at sea, or being so labour-some as to roll away her masts, &c. by being improperly stowed, which is often the case.

When a ship is new, it is prudent to consult the builder, who may be supposed best acquainted with a ship of his own planning, and most likely to ascertain what her properties will be, to judge how the cargo of materials, according to the nature of them, ought to be disposed of to advantage, so as to put her in the best sailing trim; and at

every favourable opportunity afterwards, it will be proper to find out her best trim by experiment.

Ships must differ in their form and proportional dimensions; and to make them answer their different purposes, they will require different management in the stowage, which ought not to be left to mere chance, or done at random, as goods or materials happen to come to hand, which is too often the cause that improper stowage makes ships unfit for sea: therefore the stowage should be considered, planned, and contrived, according to the built and properties of the ship, which, if they are not known should be inquired after. If she be narrow, and high-built in proportion, so that she will not shift herself without a great weight in the hold, it is a certain sign that such a ship will require a great part of heavy goods, ballast, or materials, laid low in the hold, to make her stiff enough to bear sufficient sail without being in danger of oversetting. But if a ship be built broad, and low in proportion, so that she is stiff and will support herself without any weight in the hold, such a ship will require heavy goods, ballast, or materials, stowed higher up, to prevent her from being too stiff at sea, so as to endanger her masts being rolled away, and the hull worked loose and made leaky.

In order to help a ship's sailing, that she should be lively and easy in her pitching, and ascending, motions, it should be contrived by the stowage, that the principal and weightiest part of the cargo or materials, should lie as near the main body of the ship, and as far from the extreme ends, fore and aft, as things will admit of. For it should be considered, that the roomy part of our ships lengthwise, forms a sweep or curve near four times as long as they are broad; therefore those roomy parts at, and above, the water's edge, which are made by a full harping, and a broad transom to support the ship steady, and keep her from plunging into the sea, and also, by the entrance and run of the ship having little, or no, bearing body under for the pressure of the water to support them, of course should not be stowed with heavy goods or materials, but all the necessary vacancies, broken stowage, or light goods, should be at these extreme ends, fore, and aft; and in proportion as they are kept lighter by the stowage, the ship will be more lively to fall, and rise, easy in great seas; and this will contribute greatly to her working and sailing, and to prevent her from straining and hogging; for which reason it is a wrong practice to leave such a large vacancy in the main hatchway as is usual, to coil and work the cables, which ought to be in the fore, or aft, hatchway, that the principal weight may be more easily stowed in the main body of the ship, above the flattest and lowest floorings, where the pressure of the water acts the more to support it.

SHIPS, *Masts of.* The mast of a ship is a long round piece of timber, elevated perpendicularly upon the keel of a ship, to which are attached the yards, the sails, and the rigging. A mast, with regard to its length, is either formed of one single piece, which is called a pole-mast, or composed of several pieces joined together, each of which retains the name of mast separately. The lowest of these is accordingly named the lower-mast; the next in height is the top-mast, which is erected at the head of the former; and the highest is the top-gallant mast, which is prolonged from the upper end of the top-mast. Thus the two last are no other than a continuation of the first upwards.

The lower mast is fixed in the ship; the foot, or heel of it, rests on a block of timber called the step, which is fixed upon the keelson, and the top-mast is attached to the head of it by the cap, and the trestle-trees. The latter of these are two strong bars of timber, supported by two prominences, which are as shoulders on the opposite sides of the mast, a little under its upper end: athwart these bars are fixed the cross-trees, upon which the frame of the top is supported. Between the lower-mast-head, and the foremost of the cross-trees, a square space remains vacant, the sides of which are bounded by the two trestle-trees. Perpendicularly above this is the foremost hole in the cap, whose after-hole is solidly fixed on the head of the lower-mast. The top-mast is erected by a tackle, whose effort is communicated from the head of the lower-mast to the foot of the top-mast; and the upper end of the latter is accordingly guided into, and conveyed up through, the holes between the trestle-trees and the cap.

Besides the parts already mentioned in the construction of masts, with respect to their length, the lower-masts of the largest ships are composed of several pieces united into one body. As these are generally the most substantial parts of various trees, a mast formed by this assemblage, is justly esteemed much stronger than one consisting of any single trunk, whose internal solidity may be very uncertain.

The whole is secured by several strong hoops of iron, driven on the outside of the mast, where they remain at proper distances.

The principal articles to be considered in equipping a ship with masts are, 1, the number; 2, their situation in the vessel; and 3, their height above the water.

The masts being used to extend the sails by means of their yards, it is evident that, if their number were multiplied beyond what is necessary, the yards must be extremely short, that they may not entangle each other in working the ship, and by consequence their sails will be very narrow, and receive a small portion of wind. If, on the contrary, there be not a sufficient number of

masts in the vessel, the yards will be too large and heavy, so as not to be managed without difficulty. There is a mean between these extremes, which experience, and the general practice of the sea, have determined; by which it appears, that in large ships every advantage of sailing is retained by three masts and a bowsprit.

The most advantageous position of the masts is undoubtedly that, from whence there results an equilibrium, between the resistance of the water on the body of the ship on one part, and of the direction of their effort on the other. By every other position this equilibrium is destroyed, and the greatest effort of the masts will operate to turn the ship horizontally about its direction; a circumstance which retards her velocity. It is counterbalanced indeed by the helm; but the same inconvenience still continues; for the force of the wind, having the resistance of the helm to overcome, is not entirely employed to push the vessel forward. The axis of the resistance of the water should then be previously determined, to discover the place of the mainmast, in order to suspend the efforts of the water equally, and place the other masts so that their particular direction will coincide with that of the main-mast. The whole of this would be capable of a solution, if the figure of the vessel was regular, because the point about which the resistance of the water, would be in equilibrio, might be discovered by calculation.

The exact height of the masts, in proportion to the form, and size, of the ship, remains yet a problem to be determined. The more the masts are elevated above the centre of gravity, the greater will be the surface of sail which they are enabled to present to the wind; so far an additional height seems to have been advantageous. But this advantage is diminished by the circular movement of the mast, which operates to make the vessel stoop to its effort; and this inclination is increased in proportion to the additional height of the mast, an inconvenience which it is necessary to guard against. Thus, what is gained upon one hand is lost upon the other. To reconcile these differences, it is certain that the height of the mast ought to be determined by the inclination of the vessel, and that the point of her greatest inclination should be the term of this height above the centre of gravity. In order to secure the masts and counterbalance the strain they receive from the effort of the sails impressed by the wind, and the agitation of the ship at sea, they are sustained by several strong ropes, extended from their upper ends to the outside of the vessel, called the shrouds. These are further supported by other ropes, stretched from their heads towards the fore part of the vessel.

The mast, which is placed in the middle of the ship's length, is called the main-mast;

that which is placed in the fore-part, the fore-mast; and that which is towards the stern, is termed the mizen-mast. *See* MAST.

SHIPPING AND TRADE. The earliest statute on this subject, which we shall notice here, is the 5 Rich. 2. c. 3. by which it was ordained that "none of the king's liege people should ship any merchandise into, or out of, the kingdom, but only, in ships of his majesty's licence, on pain of forfeiture. Such were the rudiments of that code of laws, by which the English navy, and English commerce, have been brought to the state, in which we have to contemplate them in this volume.

The general subject of navigation has been sufficiently treated under that title; to this more particularly belong the consideration of shipping abstractedly, and some notice of the system of laws relating to the prohibitions, and protections, which attach to our shipping.

First, then, respecting our shipping abstractedly. By 28 Edw. 3. c. 13. "no shipping fraught toward England or elsewhere, shall be compelled to come into any particular port; and in whatever port they enter, the master, mariners, and merchants shall part with what pleaseth them of their goods, and after paying custom thereof may freely depart with the remainder. By the statutes of Car. 2. (*see ante*, title NAVIGATION,) and subsequent ones, these privileges are abridged, and regulated, so far as is necessary for better securing the duties of customs, especially by 6 Geo. 1. c. 21. If a ship now have taken goods for several ports of this country upon his arrival at the first port, report must be made there of the whole cargo, in like manner as if it were all to be there delivered, distinguishing the particular sorts of goods to be delivered at each port. And by 5 Geo. 3. c. 45. goods found concealed without entry, &c. shall be forfeited.

By 19 Geo. 3. c. 48. every vessel coming from foreign parts within the limits of the port of London, which shall be removed out of the stream, except to the lawful quays, before all the goods are discharged; or, if outward bound with goods aboard, shall be so removed out of the stream, except to the lawful quays or by accident, &c. without consent of commissioners of customs, the master shall forfeit 100*l.* (with the exception of vessels passing between England and Ireland, by 51 Geo. 3. c. 24.)

Cutters, luggers, shallops, and wherries, belonging in whole, or in part, to any of his majesty's subjects, are prohibited, under pain of forfeiture, from being built, rigged, or fitted otherwise than as directed by 24 Geo. 3. c. 47., 27 Geo. 3. c. 32., 38 Geo. 3. c. 33. By 47 Geo. 3. c. 66. and 48 Geo. 3. c. 84., the number of persons by whom such vessels are to be navigated, is regulated in proportion to the tonnage of such vessels

respectively; and disobedience incurs a forfeiture. The reasons for these regulations having been adopted were to prevent smuggling; wherefore by the later statutes of this reign above enumerated, a power is vested in the commissioners of customs to grant licences to certain of these vessels before described (notwithstanding the general prohibitions), though otherwise built, &c. than as the statutes prescribed, for navigating in the course of lawful trade. For more information on this portion of the subject, we refer the reader to cases in Anstruther's Exchequer Rep. and *post.* SMUGGLING.

Secondly, respecting the course of trade carried on by our shipping, with the different countries of the world. This head of discussion naturally resolves itself into three distinct branches, viz. 1st, the trade of Great Britain with her own colonies and dependencies; 2dly, her trade with foreign countries not under her jurisdiction or control; and 3dly, the trade permitted by her to be carried on directly between such colonies or dependencies, and such foreign countries.

Immense in quantity, and diversified in matter, as the laws relating to this complicated subject, with all their concomitants of duties, drawbacks, bounties, prohibitions, &c. &c. present themselves, it has been found entirely impracticable to reduce the substance of them into any state of abridgment which would be sufficiently comprehensive to be useful, and at the same time admissible into a work of this kind. It has been thought best, therefore, to give a correct enumeration of the several statutes immediately connected with this part of the subject, which have been enacted from a period so early as the reign of Edward III. specifying the particular object, or objects, to which they are respectively applicable: by these means every individual subject of commercial enquiry may be traced in its progress, from the first and fundamental provision respecting it, through all its successive amendments, alterations, and collateral bearings, to its most recent and most minute regulation, modification, or adjustment.

For further information on the subject of SHIPPING AND TRADE, see the articles COMMERCE, EUROPE, FISHERY, INSURANCE, PRIZE-SHIPS, REGISTER, SMUGGLING MASTERS OF

SHIPS, OWNERS OF SHIPS, CUSTOMS, DUTIES, NAVIGATION, &c.

SHIPPING-ORDER, is a written mandate directed by a merchant to his lighter-man, ordering him to receive and put on board a certain ship, the goods and merchandise specified in the order. This order is generally delivered to the manufacturer or trader who makes up the goods to be shipped, and who sends it down with them to the water-side. The following is the form of a shipping order.

Messrs. T. and I. Belts, please to receive the goods as under, and to ship them per first tide on board the *Lovely Peggy*, Capt. D —, lying off the Tower, and bound for Jamaica.

John Gregson and Co.

N. B. 1 at 4. Four Cases of Castor hats.

W. D. 12 at 15. Four Bales of woollen cloth.

J. C. 50 at 60. Eleven Puncheons haberdashery.

SHIVERS, or **SHEEVERS**, in the sea-language, names given to the little rollers or round wheels of pullies.

SHOES, (GER. *Schuhe*. DU. *Schoenen*. DA. *Skoe*. SW. *Skor*. FR. *Souliers*. IT. *Scarpe*. SP. *Zapatos*. PORT. *Sapatos*. RUS. *Baschmaki*.) coverings for the feet, usually made of leather, by the company of Cordwainers. There are few trades more useful than that of the shoe-maker, and perhaps not many that are more profitable, when it is carried on to a considerable extent. Ladies' shoe-makers have the most precarious part of this trade in their hands, owing to the frequent change of fashion, not only in the form, but in the material of the article, in which they deal. The best men's shoes are manufactured at London, and are commonly known by the hackneyed appellation of *town-made*; however, vast quantities of inferior kinds of shoes are sold in the metropolis, which are manufactured in Scotland, as well as in Staffordshire, and some other parts of England. Shoes are exported in considerable quantities to the north of Europe, to Asia, Africa, American Continent, and the West Indies.

SHOPBOARD, is the table upon which tailors, and some other sedentary mechanics, perform their work.

SHOT, a denomination given to all sorts of balls for fire-arms; those for cannon being of iron, and those for guns, pistols, &c. of lead.

SHOT, *Case*, formerly consisted of all kinds of old iron, nails, musket-balls, stones, &c. used as above.

SHOT, *of a cable*, on ship-board, is the splicing of two cables together, that a ship may ride safe in deep waters, and in great roads; for a ship will ride easier by one shot of a cable, than by three short cables out a-head.

SHOT, *Grape*. See **GRAPE-SHOT**.

SHOT, commonly called *patent milled*,

is thus made; sheets of lead, whose thickness corresponds with the size of the shot required, are cut into small pieces, or cubes, of the form of a die. A great quantity of these little cubes are put into a large hollow iron cylinder, which is mounted horizontally, and turned by a winch; when by their friction against one another, and against the sides of the cylinder, they are rendered perfectly round, and very smooth. The other patent-shot is cast in moulds, in the same way as bullets are.

SHOT, *common small*, or that used for fowling, should be well sized; for, should it be too great, then it flies thin, and scatters too much; or if too small, then it has not weight and strength to penetrate far, and the bird is apt to fly away with it. In order, therefore, to have it suitable to the occasion, it not being always to be had in every place fit for the purpose, we shall set down the true method of making all sorts and sizes, under the name of mould-shot, formerly made after the following process:

Take any quantity of lead you think fit, and melt it down in an iron vessel; and as it melts, keep it stirring with an iron ladle, skimming off all impurities whatsoever, that may arise at top; when it begins to look of a greenish colour, strew on it as much auripigmentum, or yellow orpiment, finely powdered, as will lie on a shilling, to every twelve or fourteen pounds of lead; then stirring them together, the orpiment will flame. The ladle should have a notch on one side of the brim, for more easily pouring out the lead; the ladle must remain in the melted lead, that its heat may be the same with that of the lead, to prevent inconveniences which otherwise might happen, by its being either too hot, or too cold; then, to try your lead, drop a little of it into water, and if the drops prove round, then the lead is of a proper heat; if otherwise, and the shot have tails, then add more orpiment to increase the heat, till it is found sufficient.

Then take a plate of copper, about the size of a trencher, which must be made with a hollowness in the middle, about three inches compass, within which must be bored about 40 holes, according to the size of the shot which you intend to cast; the hollow bottom should be thin; but the thicker the brim, the better it will retain the heat. Place this plate on a frame of iron, over a tube or vessel of water, about four inches from the water, and spread burning coals on the plate, to keep the lead melted upon it; then take some lead and pour it gently on the coals on the plate, and it will make its way through the holes into the water, and form itself into shot; do thus till all your lead is run through the holes of the plate, taking care, by keeping your coals alive, that the lead does not cool and so stop up the holes.

While you are casting in this manner, another person with another ladle may catch

some of the shot, placing the ladle four or five inches underneath the plate in the water, by which means you will see if they are defective, and rectify them. Your chief care is to keep the lead in a just degree of heat, that it shall not be so cold as to stop up the holes in your plate, nor so hot as to cause the shot to crack; to remedy the heat, you must refrain working, till it is of a proper coolness; and to remedy the coolness of the lead and plate, you must blow your fire; observing, that the cooler your lead is, the larger will be your shot; as, the hotter it is, the smaller they will be.

After you have done casting, take them out of the water, and dry them over the fire with a gentle heat, stirring them continually that they do not melt; when dry, you are to separate the great shot from the small, by the help of a sieve made for that purpose, according to their several sizes. But those who would have very large shot, make the lead trickle with a stick out of the ladle into the water, without the plate. If it stops on the plate, and yet the plate is not too cool, give but the plate a little knock, and it will run again; care must be had, that none of your implements are greasy, oily, or the like; and when the shot, being separated, are found too large, or too small for your purpose, or otherwise imperfect, they will serve again at the next operation.

SHOT, *Tin-case*, in artillery, is formed by putting a great quantity of small iron shot into a tin cylindrical box, called a cannister, that just fits the bore of the gun. Lead bullets are sometimes used in the same manner; and it must be observed, that whatever number, or sizes, of the shots are used, they must weigh, with their cases, nearly as much as the shot of the piece.

SHROWDS, or **SHROUDS**, in a ship, are the great ropes which come down both sides of the masts, and are fastened below to the chains on the ship's side, and aloft to the top of the mast; being parcelled and served, in order to prevent the mast's galling them. The topmast-shrowds are fastened to the futtock-plates, by dead-eyes and laniards, as the others are. Some of the terms relating to the shrowds are: ease the shrowds; that is, slacken them: and, set up the shrowds; that is, set them stiffer, &c. &c.

SHRUB, a beverage composed of sugar, acid, and spirit, in which the latter predominates.

SHRUFF, old brass.

SHUMACH. See **SUMACH**.

SHUTTLE, in the manufactures, an instrument much used by weavers, in the middle of which is an eye, or cavity, wherein is inclosed the spool with the woof. See **WEAVING**.

SICILIAN-EARTH, or **FOSSIL BEZOAR**, is a kind of figured stone, formed like the animal *Bezoar*, and supposed to have the same virtues. It is of a purple colour, the

size of a walnut, and light. It is called Sicilian-earth, because it is chiefly found in Sicily.

SIGNATURE, in ordinary concerns, means a name, or initials of a name, *signed*, or subscribed at the bottom of any page or sheet, in order to identify it. In printing, it signifies a letter put at the bottom of the first page at least, in each sheet, as a direction to the binder, in folding, gathering, and collating them. The signatures consist of the capital letters of the alphabet, which change in every sheet: if there are more sheets than letters in the alphabet, to the capital letter is added a small one of the same sort, as A a, B b; which are repeated as often as necessary. In large volumes, it is usual to distinguish the number of alphabets, after the first three or four, by placing a figure before the signature, as 5 B, 6 B, &c.

SILK, (*GER. Seide. DU. Zyde, Zy. DA. and Sw. Silke. FR. Soie. IT. Seta. SP. and PORT. Seda. RUS. Schelk. POL. Jedwab. LAT. Sericum*), a very soft, fine, bright thread, the work of an insect, called the bombyx, or the silk-worm. As the silk-worm is a native of China, the culture of the silk, in ancient times, was entirely confined to that country. Till the reign of Justinian, the silk-worm was unknown beyond the territories of China; but silk was introduced into Persia long before that period. After the conquest of the Persian Empire by Alexander the Great; this valuable commodity was brought into Greece, and thence conveyed to Rome. The first of the Roman writers extant, by whom silk is mentioned, are Virgil and Horace; but it is probable that neither of them knew from what country it was obtained, nor how it was produced. Among the Romans, silk was deemed a dress too expensive and delicate for men, and was wholly appropriated to women of eminent rank, and opulence. For several centuries, the Persians supplied the Roman empire with the silks of China. Caravans traversed the whole latitude of Asia, in 245 days, from the Chinese ocean to the sea-coasts of Syria, carrying this commodity. Sometimes it was conveyed to the ports of Guzerat and Malabar, and thence transported by sea to the Persian gulf.

In the reign of the Emperor Justinian, however, we are informed a number of the eggs of the silk-worm were conveyed by artifice to the capital; from which beginning, vast numbers were soon after reared in different parts of Greece. Sicily afterwards undertook to breed silk-worms with equal success: and was imitated by several towns of Italy. In all these places extensive manufactures were established, and carried on with silk of domestic production. The demand for silk from the East diminished of course, and a considerable change took place in the nature of the commercial intercourse between India, and Europe.

The silk-worm is a species of caterpillar,

which, like all others of the same class, undergoes a variety of changes. It is produced from a yellowish-coloured egg, about the size of a pin's head, which has been laid by a greyish-coloured moth, vulgarly confounded with the butterfly. These eggs in the temperature of this climate, even in summer, may be prevented from hatching, if they be kept in a cool place; and when the food on which the worm is fed is in perfection, the eggs need only be exposed to the sun for a day or two, when they will be hatched with great facility.

When the animal is first protruded from the egg, it is a small black worm, which is active in search of food. At this stage of its growth, the silk worm requires to be fed with the youngest, and most tender, leaves. On these it will feed very freely, for about eight days, during which time it increases in size to about a quarter of an inch in length. It is then attacked with its first sickness, which consists in a sort of lethargic sleep, of about three days continuance, during which time it refuses to eat, and changes its skin; preserving the same bulk. This sleep being over, it begins to eat again during five days, at which term it is grown to the size of full half an inch in length. After this follows a second, then a third, and a fourth sickness, in every respect like the former; and after every sickness it feeds again for five days. At the time it is attacked by its fourth sickness, it is arrived at its full growth; and on recovering, it feeds once more during five days, with a most voracious appetite; after which it disdains its food, becomes transparent, a little on the yellowish cast, and leaves its silky traces on the leaves where it passes. These signs denote, that it is ready to begin its cocoon. Thus it appears, that the whole duration of the life of the worm, in this state of its existence, in our climate, is usually forty days; twenty-eight of which days it takes food, and remains in its sick or torpid state about twelve; but it is to be observed, that warm weather shortens, and cold weather prolongs, the periods of sickness. When the worm is come to full perfection, it searches about for a convenient place for forming its cocoon, and mounts upon any branches or twigs that are put in its way for that purpose. After about two days spent in this manner, it settles in its place, and forms the cocoon, by winding the silk, which it draws from its bowels, round itself, into an oblong roundish ball. During this operation, it gradually loses the appearance of a worm; its length is much diminished, and its breadth augmented. By the time the web is finished, it is found to be transformed into an oblong roundish ball, covered with a smooth shelly skin, and appears to be perfectly dead. In this state it remains for several days, entirely motionless, in the heart of the cocoon, after which it bursts, like an egg hatching, and from that comes forth a

heavy, dull-looking moth, with wings; but these wings it never uses for flying. This creature forces its way through the silk covering which the worm had woven, goes immediately in quest of its mate, after which the female lays her eggs; and both male and female, without tasting food in this stage of their existence, die in a very short time.

The silk-worm, when at its full size, is from an inch and a quarter, to an inch and a half, in length, and about half an inch in circumference. It is either of a milk or pearl colour, or blackish; these last are esteemed the best. The body is divided into seven wings, to each of which are joined two very short feet. It has a very small point like a thorn, exactly above the anus. The substance which forms the silk is in his stomach, which is very long, wound up, as it were, upon two spindles, and surrounded with a gum, commonly yellowish, sometimes white, but seldom greenish. When the worm spins his cocoon, he winds off a thread from each of his spindles, and joins them afterwards, by means of two hooks, which are placed in his mouth, so that the cocoon is formed of a double thread.

Of silk-worms, as of most animals, there is a considerable variety of species, some of which are much more hardy, and possess qualities materially different from others. This is a particular of much importance to be adverted to, at the time of beginning to breed these creatures in any place.

Though the silk-worm be a native of China, there is no doubt but it might be propagated in most parts of the temperate zones. The mulberry tree, upon the leaves of which it lives, is a hardy vegetable, bearing without injury, even the winters of Siberia, and could without doubt be reared in Great Britain. Nature, therefore, has furnished us with every thing necessary for the silk manufacture.

The cocoons from which the silk is to be immediately wound, must be submitted to the heat of an oven, in order to kill the *chrysalis* or *aurelia*, which would otherwise eat its way through the cocoon, and render it useless. Good cocoons are strong, small, and firm; have a fine grain, both ends round, and they are free from spots. Of the bad cocoons there are six species. 1. The pointed cocoons, one extremity of which is a point, the silk which covers the point is weak, and soon breaks or tears. 2. The cocalons, which are bigger, but the contexture is weak. 3. The dupions, or double cocoons. 4. The soufflons, which have a loose contexture, sometimes so loose, that they are transparent. 5. The perforated cocoons, which have a hole at one end. 6. The bad choquette, which is composed of spotted or rotten cocoons.

The cocoons which are kept for breeding are called royal cocoons. The largest and the best cocoons ought to be preserved for

breed, about an equal number of males and females, though one male will serve two or three females, if the time of coming out of the cocoon answers. About twelve or fifteen days after they begin to spin, the cocoons for breed may be laid on sheets of white paper; as about this time the moth opens for itself a passage through the end of the cocoon. When the female has laid her eggs, which, on an average, may amount to two hundred and fifty, they are spread upon paper, and hung up to dry in some cool place.

The next operation is the winding of the silk, before which the cocoons must be prepared as follows:

1. Strip them of the waste silk that surrounds them, and which served to fasten them to the twigs. This burr is proper to stuff quilts, or for other such uses; you may likewise spin it to make stockings, but they will be very coarse and ordinary.

2. You must sort your cocoons, separating them into different classes, in order to wind them apart. These classes are, the good white cocoons; the good cocoons of all other colours; the dupions; the cocalons, among which are included the weak cocoons; the good choquette; and, lastly, the bad choquette. In sorting the cocoons, you will always find some perforated cocoons among them, whose worm is already born; these you must set apart for fleuret. You will likewise find a few soufflons; but being very few, they may be put among the bad choquette. The good cocoons, as well white as yellow, are the easiest to wind: those which require the greatest care and pains are the cocalons; you must wind them in cooler water than the others; and if you take care to give them a good windster, you will have as fair silk from them as from the rest. You must likewise have careful windsters for the dupions and choquettes. These two species require hotter water than the common cocoons.

The cocoons produce a thread of very unequal length; you may meet with some that yield more than 1220 ells, whilst others will scarcely afford 200 ells. In general, you may calculate the production of a cocoon at from 500 to 600 ells in length.

The silk imported into this country is the produce of Italy, Turkey, and the East Indies.

The kingdom of Naples is computed to yield about 800,000 lbs. of silk annually; of which half is supposed to be worked at home, and the other half exported raw. The red mulberry-tree is invariably used as the food of the silk-worm in Calabria; and it is the opinion of the silk-workers, that worms fed with it, produce a more compact heavy silk, than those that live upon the leaves of the white one. This, however, seems to be a mere prejudice, as the Chinese, Piedmontese, and Languedocians prefer the

white sort. In case of a blight among the mulberry trees, bramble tops have been found the best succedaneum. The silk-worm houses in Calabria, are mostly the property of reputable families in Reggio, who furnish rooms, leaves, eggs, and every necessary implement; take two-thirds of the profit, and leave the rest for the artisans. A succession of eggs is imported from Leghorn and other places, to renew the breed, and by frequent changes keep up the quantity of silk.

Silk is an important branch of the commerce of the island of Cyprus. The breeding of silk-worms here, is not subject to the inconveniences arising from the variations of the atmosphere, as it is in other parts. The finest, and whitest, silk is that produced in the environs of Famagusta, and Carpasia. The orange and sulphur coloured come from Cythera, or the villages beyond the northern mountains; and that of a gold yellow colour, is produced in the territory of Paphos and the neighbouring country. That principally esteemed in Europe, is the white silk, with which a little of the orange, and the sulphur coloured, is sometimes mixed. Venice, and Leghorn receive both, though the white silk has also there the preference. The island produces, on an average, 25,000 bags of silk annually. It is not uncommon, in Cyprus, to receive commissions from Constantinople, Aleppo, and Egypt, for silk which is afterwards sent to Europe. The silk trade is protected by a great number of statutes in these kingdoms; and the manufacture has of late years arrived at a degree of perfection even to rival those of India and of France. The manufacturers are protected from the frauds and embezzlement of their servants, by a succession of statutes passed from the 13 Car. 2. to nearly the present time; but the most important, to be noticed for the information of persons immediately concerned, are 22 Geo. 2. c. 27. 17 Geo. 3. c. 56. and 32 Geo. 3. c. 44.

By these, almost every species of fraud, that ingenuity can devise in the process of manufacturing silk goods, to defraud the owners, is duly provided against.

This manufacture is further encouraged by the laws of customs, which subject the importation of foreign silk goods of all descriptions, to extremely heavy duties, under very severe penalties.

Certain bounties are allowed by divers acts, beginning with 8 Geo. 1. c. 15., on the exportation of British manufactured silk. The 53 Geo. 3. c. 30. also gives a bounty on the exportation of goods manufactured from *refuse* or *waste* silk, provided the value of the goods be at least four times the amount of the bounty claimed thereon.

SILVER, (*GÆR. Silber. Du. Zilver. Da. Sølv. Sw. Silfver. Fr. Argent. It. Argento. Sp. Plata. Port. Prata. Rus. Серебро. Pol. Srebro. Lat. Argentum.*) is a metal of a fine white colour, without

either taste or smell; and in point of brilliancy perhaps inferior to none of the metallic bodies, if we except polished steel. When melted, its specific gravity is 10.478; when hammered, 10.609. In malleability, it is inferior to none of the metals, if we except gold, and perhaps also platinum. It may be beaten out into leaves only $\frac{1}{160000}$ inch thick. Its ductility is equally remarkable: it may be drawn out into wire much finer than a human hair; so fine, indeed, that a single grain of silver may be extended about 400 feet in length. Its tenacity is such, that a wire of silver 0.078 inch in diameter is capable of supporting a weight of 187.15 lbs. *avoirdupois* without breaking.

The most considerable silver mines are at Potosi in South America, Kunsberg in Norway, Annaberg in Austria, the Hartz, Saxony in general, Schemnitz in Hungary, &c.

The uses of silver are well known: it is chiefly applied to the forming of various utensils for domestic use, and as the medium of exchange in money. Its disposition to assume a black colour by tarnishing, and its softness, appear to be the chief objection to its use in the construction of graduated instruments for astronomical, and other, purposes, in which a good white metal would be a desirable acquisition. Oxide of silver communicates an olive colour to glass. A solution of silver in nitric acid, diluted with water, will stain the skin and other animal substances of an indelible black. It is thus employed for dying human hair; for staining marbles, jaspers, &c., and for silvering ornamental work. It has also been employed for silvering ivory. A solution of nitrate silver, mixed with a little gum, forms the indelible ink for marking linen; the linen must be previously moistened with a solution of potash.

SILVERING. There are various methods of giving a covering of silver or silvery aspect to the surfaces of bodies. The application of silver leaf is made in the same way as that of gold, for which *see* GILDING.

Copper may be silvered over by rubbing it with the following powder: Two drachms of tartar, the same quantity of common salt, and half a drachm of alum, mixed with fifteen, or twenty, grains of silver precipitated from nitric acid by copper. The surface of the copper becomes white when rubbed with this powder, which may afterward be brushed off, and polished with leather.

The saddlers, and harness makers, cover their wares with tin for ordinary uses, but a cheap silvering is used for this purpose as follows: Half an ounce of silver, that has been precipitated from aquafortis by the addition of copper, common salt, and muriat of ammonia, of each two ounces, and one drachm of corrosive muriat of mercury, are triturated together, and made into a paste with water; with this, copper utensils of

every kind, that have been previously boiled with tartar and alum, are rubbed, after which they are made red hot, and then polished. The intention of this process appears to be little more than to apply the silver in a state of minute division to the clean surface of the copper, and afterward to fix it there by fusion; and accordingly this silvering may be effected by using the argentine precipitate here mentioned, with borax or mercury, and causing it to adhere by fusion.

The dial-plates of clocks, the scales of barometers, and other similar articles are silvered by rubbing upon them a mixture of muriat of silver, sea-salt, and tartar, and afterward carefully washing off the saline matter with water. In this operation, the silver is precipitated from the muriatic acid, which unites with part of the coppery surface. It is not durable, but may be improved by heating the article, and repeating the operation till the covering seems sufficiently thick.

The silvering of pins is effected by boiling them with tin melted, and broken into very minute particles, for the explanation of which *see* PIN MAKING.

For the mode of silvering looking-glasses, *see* FOLIATING.

SILVER-LEAF, that beaten out into fine leaves for the use of the gilders, which is performed in the same manner as gold-leaf.

SILVER-WIRE, that drawn out into fine wire; for the manner of doing which, *see* the articles GOLD-WIRE, and WIRE-DRAWING.

SILVER, Shell, is prepared of the shreds of silver-leaves, or of the leaves themselves, for the use of painters, after the same manner as shell-gold. *See* GOLD.

SILVERSMITH. *See* GOLDSMITH.

SIMPLE CONTRACT. This is a term used to distinguish debts due for money lent, goods sold and delivered; as, book debts, bills of exchange, promissory notes, &c. from debts due upon specialties or contracts under seal, as bonds, deeds, &c.

Debts by simple contract, in case of the death of the party, are postponed to all other debts of a higher class; and if the personal representative discharge debts due by simple contract, before those due upon instruments under seal, in case of a deficiency of assets he will be liable to make those good out of his own personal estate.

SINGLO TEA, a sort of green tea, so called from the place where it is cultivated. *See* TEA.

SINKING FUND. A fund formed of the excess or surplus of the duties composing the revenue of the state. It is of more antiquity than is generally supposed; for it has existed ever since the 3d of Geo. I., and was then appropriated by act of parliament for the sole purpose of discharging the na-

tional debt, previously imposed. The necessities of the state, however, induced successive ministers, *partially* at least, to divert this accumulation, from time to time, into other channels, in relief of the annual burdens of the country. Little, comparatively, as had been the benefit to the nation, therefore, from this surplus, in that particular point of view for which a sinking fund was first created, the principle inculcated by its establishment was too obvious to escape the notice of future financiers. Mr. Pitt, (as it was said, by the advice of the celebrated Dr. Price) in 1786, created the new sinking fund, on the basis of the old one, providing at the same time, so far as the power of parliament could do it prospectively, against misapplications of its produce, similar to those which had taken place with respect to that which he had taken for his model. The preamble of the statute by which it was established, 26 Geo. 3. c. 31., recites, at the same time, the necessity which had previously subsisted for the measure, and the reasons for the former act having failed to attain the object, viz. "for the want of sufficient provisions for the constant application of the monies, according to the true intent of the said acts." The statute itself then directs, that on the 5th day of July, and the 10th day of October, in that year, viz. 1786; and at the end of every quarter of a year, viz. Jan. 5th, April 5th, July 5th, and Oct. 10th, respectively, in every succeeding year, there shall be issued and set apart at the Exchequer, pursuant to the several acts in that behalf made, out of the monies composing the aforesaid sinking fund, a sufficient sum to make good, to such quarter-day, all such interest or annuities, or deficiencies of funds provided for payment thereof, as shall be specially charged on said sinking fund; and after such sum shall have been so set apart and issued, there shall then be further set apart, in the said Exchequer, out of the surpluses, &c. composing the said fund, a sum of 250,000*l.*, or such part thereof as such excesses and surpluses then remaining in said Exchequer shall be sufficient to satisfy. It then directs that the deficiencies, if any, shall be charged to the succeeding quarter; and if there be any at the end of the year, they shall be made good out of the supplies granted for the same year: that at the end of each quarter the monies so set apart at the Exchequer shall be paid into the Bank of England, to an account of certain commissioners for applying certain sums to the reduction of the national debt: that such stock as shall be bought up, or redeemed, shall be transferred to the account of the commissioners, in the several books of the Bank, the South-Sea-house, and the East India-house, and the dividends which fall due on such redeemed stock shall be carried to the said account. That the several annuities

which had from time to time been granted for lives, or for terms of years, instead of being dropped at the end of their term, should be continued; but after the claims of the annuitants should cease, they should go to the account of the commissioners.

It directs the commissioners to apply the monies placed in their hands to the payment or redemption of annuities at, or above, par, or to the purchase of such as are below par; and enables them to subscribe to any future loans. It provides, further, that whenever the whole sum annually receivable by the said commissioners, including as well the annual million issued quarterly, as the several annuities and dividends of stock, shall amount to four millions, then the terminable annuities which may afterwards fall in, and the dividends of stock which may be henceforth bought, shall no longer be issued from the exchequer, but shall be considered as redeemed, and held at the disposal of parliament.

In 1792, a further augmentation was made to this sinking fund, by providing that, along with the interest set apart out of the consolidated fund for the satisfying of future loans, there should be issued a sum equal to one per cent. on the stock created by the loan, and placed quarterly in the hands of the commissioners. In 1802 another act was passed, the preamble of which recited the good effects which had been already produced by the sinking fund, and after repealing such parts of the former statutes of 26 and 32 Geo. 3., it limited the amount of the fund to four millions, with some modifications of other provisions in the same, directs that the money placed to the account of the commissioners shall accumulate, and be applied to the redemption of public annuities, until the whole shall be paid off, within 45 years from their respective creation.

In the session of parliament of 1813, 53 Geo. 3., further provisions were made for accelerating the reduction of this national debt, which were preceded by certain resolutions in the commons, descriptive of its actual state, and of the progress which had then been made. By these, it is first stated that the total capital of the funded debt of Great Britain was, on the 5th of Jan. 1786, 238,231,248*l.* 5*s.* 2½*d.*; that in consequence of the several provisions made by statute for its reduction, the sum of 238,250,143*l.* 18*s.* 1*d.* (exceeding the said former sum by 118,895*l.* 12*s.* 10½*d.*) had, since that period, been actually purchased by the commissioners, and applied by them in reduction of the national debt. The statutable enactments which then followed these, and others, the resolutions, of which the act was a mere echo, provided, among other matters, that "in order to carry into effect the redemption of every part of the national debt, within 45 years from the time

of its creation; in future, whenever the amount of the sum to be raised by loan, or other addition to the funded debt, shall in any year exceed the sum estimated to be applicable, shall be set apart out of the monies composing the consolidated fund, and shall be issued at the receipt of the Exchequer, to the Governor and Company of the Bank of England, to be by them placed to the account of the commissioners; and upon the remainder of such loan or other addition, the annual sum of one per cent. on the capital thereof, according to the provisions of the anterior statutes. And that, in order to prevent the increase of the public debt, by means of exchequer bills, annually renewed on the 5th of Jan. in every year, an account shall be taken of all Exchequer bills outstanding, and charged upon funds not deemed capable of making good the same,

within one year from such 5th of January, and a sum equal to one per cent. thereupon shall be granted out of the supplies of such year to the said commissioners. That on such part of the capital stock created by loans and fundings, belonging to the sum of 13,013,914 $\frac{1}{2}$ sterling, (the amount deemed applicable to the reduction of the national debt, (1st Feb. 1813,) an annual sum equal to one per cent., and charges of management, should be issued to the account of the commissioners, and that on the capital stock created by the remainder, or excess on the said sum applicable, an annual sum equal to one half the interest shall be issued, for the purpose of redeeming the amount of the capitals forming such excess of debt as was created by the said fundings. See FUNDS, PUBLIC. We subjoin an abstract of the state of the sinking fund account, on 5th Jan. 1821.

The scheme of a sinking fund to liquidate the debts of a state, has something so plausible in it at first sight, that it is no great matter of wonder that this of Great Britain should have been extravagantly eulogised at home, and more, or less, so in other parts of the world. As a simple abstract proposition, and on the assumption that the taxes imposed do actually exceed the expenses for which they are destined, there can be no dispute about a sinking fund, if punctually applied, being a beneficial mode of liquidating a debt: but the machinery of that of which we have been treating is so complicated, as to divest it of one of its principal recommendations; and the delusion involved in the practice of borrowing (according to the vulgar phrase) *with the left hand, in order to pay with the right*, is rapidly passing away. The designed counterpoise, to be effected by the setting apart of one per cent. on the capital created, is a happy invention in theory; but, when it is considered that the more the commissioners have to lay out for the extinction of the debt, the higher will be the price at which they must purchase (for in proportion to the demand will always be the price of stock), when reduced to practice, no inconsiderable portion of the projected advantage vanishes. General reasoning, however, makes no necessary part of a work of this nature, and therefore we must refer the reader for that species of information to the treatises of Hamilton, and others, on this part of the subject.

SIRUP, or SYRUP, (*Syrups.* GER. *Syrup.* DU. *Syroop.* DA. *Sirop, Sirup.* SW. *Sirap, Sirop.* FR. *Syrops, Sirops.* IT. *Saroppe.* SP. *Jaropes, Jarabes.* PORT. *Exaropes, Xaropes.* LAT. *Syropi*.) a liquid form of medicines prepared of decoctions, juices, or infusions, preserved by means of honey, or sugar, and reduced to such a consistence, that a drop let fall on marble does not spread.

General rules for making Syrups.

1. The sugar employed for making the syrups to be formed without coction, should be first boiled with water to a candy-consistence; observing to clarify it with the whites of eggs, and by despumation. But the whitest, and purest, sugar, and sugar-candy, do not require this labour. The sugar thus prepared, ought afterwards to be powdered, that it may dissolve the more easily.

2. Though a double weight of sugar in proportion to the liquor, may be required in making such syrups; yet a less proportion will generally suffice. First, therefore, dissolve only an equal quantity of sugar; then by degrees add a little more in powder, till it remain undissolved at the bottom, to be afterwards incorporated by the gentle heat of a water-bath.

3. Acid syrups, or those made with the juices of fruits, should not be put into copper vessels, unless tinned.

4. Syrups made by coction are to be clarified with the whites of eggs, except diacodium; which, therefore, requires the purest sugar.

SIXPENCE, the smallest silver coin current in Great Britain; being, as its title expresses, equivalent to half a shilling, or six pence.

SIZE, (GER. *Lederlein.* DU. *Léertym.* DA. *Laderlüm.* SW. *Laderlüm.* FR. *Colle de gants.* IT. *Colla di limbellucci.* SP. *Cola de retal.* PORT. *Cola de lewas*.) a viscid preparation, consisting of the threads and parings of parchment, leather, or vellum, boiled in water, after which they are strained, it is employed by various artisans, but principally by painters and plaisterers, who dilute it with a certain portion of water, and lay it on walls and ceilings, before they are painted or white washed; such liquor, however, emits a very disagreeable smell, which continues for several days, till it be perfectly dry; hence, different substitutes have been contrived, the best of which is obtained from potatoes. There are other preparations known under the name of gold, and silver, size, used by carvers, and gilders, for applying gold, and silver, leaf to frame work, as well as to various toys, and for burnishing glass; the former may be obtained, by first grinding fine bole on a marble stone, adding a little beef suet, and triturating the whole together; next some common size is to be dissolved in a double quantity of water, and mixed with the ingredients before mentioned.

Silver size may be prepared, by grinding small portions of black-lead, and tobacco-pipe clay (both being previously pulverised) with a little Genoa soap, after which it is duly incorporated with common size.

SKINNER, one who works in skins. Skinners, or fellmongers, shall not retain any journeyman, &c. to work in their trade, except they themselves have served seven years as apprentices thereto, on pain of forfeiting double the value of the wares wrought by such persons. But see 54 Geo. 3. c. 96. *ante tulle* APPRENTICE.

SKINS, (GER. *Felle.* DU. *Vellen.* DA. *Skind, Huder.* SW. *Skin.* FR. *Peaut.* IT. *Pelli.* SP. *Pielas.* PORT. *Pelles.* RUS. *Koshii.* POL. *Skory*.) the hides or pelts taken from animals to make leather. See CURRYING, FUR, HIDES, LEATHER, and TANNING.

SLAB, an outside sappy plank or board, sawed off from the sides of a timber-tree. The word is also used for a flat piece of marble.

SLATE, (GER. *Schiefer.* DU. *Arduin.* DA. *Skifer.* SW. *Skifver.* FR. *Ardoise.* IT. *Lavagna, Lastra.* SP. *Pizarra.* PORT. *Pizarra, Ardoisa.* RUS. *Tesannoi Kamen, Tscherepiza.* POL. *Lupny Kamien.* LAT. *Schistus, Ardesia*.) a fossil, consisting of a compact stone that may be split into plates.

There are several varieties of this mineral, chiefly distinguished by their colour, which is in general grey, intermixed with blue, green, or black streaks, though sometimes purplish, yellowish, brown, bluish, black, and occasionally streaked with a darker hue than the ground itself.

Slate constitutes a part of many mountains: it is found in some counties of Britain and Ireland, near the surface of the soil; the largest masses of it however, are dug in the island of Eusdale, one of the Hebrides, whence slate is annually exported to England, the West Indies, &c. to a considerable amount.

The chief purpose to which slates are applied is that of covering houses, for which they furnish a strong, and elegant, roof.

SLATES, or SLATE-BOARDS, (GER. *Rechentafeln*. DU. *Rekentaflen*. DA. *Regnetavler*. SW. *Räkentaflor*. FR. *Ardoises en tables*. RUS. *Schtschetü*.) the smooth black slates used to write upon, being generally set in a wooden frame. The species of slate employed in the formation of these useful articles, is a friable, aluminous, black slate, or, as they call it in the shops, Irish slate. It is common in many parts of Ireland, and is also found in some places in England.

SLAVE-TRADE. This iniquitous traffic being now abolished in these kingdoms, it is unnecessary to notice the subject further than, for the gratification of curiosity, to refer to the statutes by which such a desirable event has been accomplished. They were passed in the 46th, 47th, & 51st years of the reign of his late majesty, and have been explained and enforced by 58 Geo. 3. c. 49. 58 Geo. 3. c. 98. 59 Geo. 3. c. 16. & c. 17.; and 1 & 2 Geo. 4. c. 99.

SLEDGE, a kind of carriage without wheels, for the conveyance of very weighty things, as huge stones, &c.

This is also the name of a large smith's hammer, to be used with both hands. Of this there are two sorts; the up-hand sledge, which is used by under-workmen, when the work is not of the larger sort; it is used with both the hands before, and they seldom raise it higher than their head: but the other, which is called the about-sledge, and which is used for battering, or drawing out, the largest work, is held by the handle with both hands, and swung round over their heads at their arm's end, to strike as hard a blow as they can.

SLEEPERS, in a ship, timbers lying before, and aft, in the bottom of the ship, as the rung-heads do; the lowermost of them is bolted to the rung-heads, and the uppermost to the futtocks and rungs.

SLET-DOLLAR, a silver coin current in Germany, being equivalent to 3s. sterling.

SLET-MARC, a copper coin of Denmark, and Norway, passing at 5-8ths of a penny British.

SLINGING, is used variously at sea, but chiefly for the hoisting up casks, or other heavy things, with slings; i. e. contrivances of ropes spliced into themselves, at either end, with one eye big enough to receive the cask, or other thing, to be slung.

SLOOP, a sort of small ship or vessel usually with one mast, otherwise called shallop. In our navy, sloops are tenders on the men of war, and are usually of about sixty tons, and carry about thirty men.

SLOPS, a general denomination for all sorts of wearing apparel, bedding, &c. used for the outfit of mariners.

SMACK, a small vessel, usually carrying a single mast, and principally employed in fishing. Vessels of this kind are also employed in carrying fish, and other goods, as well as passengers from the North of Ireland, and Scotland to London, &c.; thus we have Berwick smacks, Leith smacks, &c.

SMALT, (GER. *Smalte*. DU. DA. and SW. *Smalt*. FR. *Smalte*. IT. *Smalto azzurro*, *Smaltino*. SP. *Esmalte*, *Azul azur*. PORT. *Esmalte*. RUS. *Lasor*. POL. *Lazur*. LAT. *Smaltum*.) a species of glass, of a dark blue colour, and which on levigating it, assumes a beautiful shade resisting the action of air, and fire: hence, if it could be rendered sufficiently fine, it would prove an excellent substitute for ultramarine.

Smalt is prepared by melting one part of calcined cobalt, with two of pulverised flint, and one of pot-ash: at the bottom of the crucibles, which are employed in manufacturing this compound, there is generally found a regulus of a whitish colour, inclining to red, and rather brittle; this, on being again melted, and becoming cold, separates into parts; that which settles at the bottom is the true cobalt, and is used to increase the quantity of smalt; the other is called bismuth.

Smalt is employed in various branches of the arts, and manufactures, particularly in colouring paper; as likewise by clear starchers in getting up fine linen, by whom it is termed powder blue. See also COBALT, and ZAFFRE.

SMEETING, the art of fusing or melting the ores of metals after roasting. It is the principal and most important of metallurgic operations; all the others being preliminary, or preparative to this. The whole attention of the miner is directed towards this process; to this all his efforts are applied, because it affords the truly useful product, to which his hopes are directed.

Though it consists in general in fusing the roasted ore to extract the metal, and in this point of view it seems to present a simple and uniform operation, there is, nevertheless, no operation which differs so much in its circumstances, according to the nature of the metal, and the ore, required to be treated, and according to the furnaces made use of, the nature and quantity of the combusti-

ble employed, the energy, duration, and administration of the fire, the addition of an appropriate flux, the heat being applied in the midst of the coal, or in crucibles, the period, the length of time, and the mode of casting the fused metal; every thing, even the form of the metal which flows out, varies, and presents to the observer very remarkable differences.

When the ore is smelted, and the metal obtained, the whole process is not yet finished. This metal is scarcely ever pure. It is either altered by certain substances foreign to its metallic nature, or it contains a portion of another metal, which alters the properties of this which is desired in a pure state; or else it contains a portion of a metal more valuable than all the rest of the mass, which it is necessary therefore to extract; or, lastly, it is an alloy, in large proportions of several metals, which are required to be separated from each other. All the operations subsequent to the smelting, are comprehended under the general name of refining, because the effect is always to obtain a pure metal.

SMITHERY, or SMITHING, a manual art, by which an irregular lump of iron is wrought into a certain shape.

This is usually performed by heating the iron to a certain degree, and then, whilst it is malleable, hammering it into the form intended.

SMOKE-JACK. See **JACK**.

SMUGGLING, is the act of illegally importing, or exporting goods, either clandestinely or in an open hostile manner, without paying the accustomed duties thereon.

The laws against the offence of smuggling, in all its varieties, are both so numerous, and so voluminous, as to defy all attempts to epitomise them in a work of this description. Suffice it to observe, that independent of the particular statutes which annex penalties of various kinds to the clandestine importation, and exportation, of particular articles of commerce, by the 9 Geo. 2. c. 35., that persons "lurking within five miles of the coast, under circumstances of suspicion," are liable to be imprisoned; that two or more persons being within the same distance of the coast, or any navigable river, with cart and horses, laden with certain articles subject to the duty of customs, not having any permit with them, are subject to transportation.

By the 19 Geo. 3. c. 69., if any disguise of their persons, or the possession of any arms be added to the offence, the offenders may be tried at the quarter sessions, and on conviction be imprisoned three years, and sentenced to hard labour. By 19 Geo. 2. c. 34., extended by 19 Geo. 5.; and lastly by 43 Geo. 3. c. 157., further enlarged and made perpetual; many of the preceding offences, with additional circumstances respecting the numbers offending, viz. three or more, and the violence exercised, are declared to be felonies *sans* clergy.

The 56 Geo. 3. c. 104., makes "more effectual provisions for the prevention of smuggling, and for rewarding officers, and persons making seizures, and capturing smuggling vessels." And 58 Geo. 3. c. 76. subjects foreigners to arrest for smuggling within certain distances of any of the dominions of his majesty; and further regulates the rewards to officers seizing goods, &c., in proportion to the tonnage of vessels seized and condemned. These acts are amended by 1 Geo. 4. c. 43. and 3 Geo. 4. c. 110. See **SEIZURE, EXCISE, &c.**

SNAKE-ROOT, Indian, (GER. *Ostendische-schlengen-wurzel*. *Mango-wurzel*. DU. *Oostindische slangenuwortel*. DA. *Indiansk slangerod*. SW. *Indiansk ormerot*. FR. *Racine de serpent*, *Mungo*. IT. *Radice di serpe*. SP. *Raiz de serpiente*. PORT. *Colubrina*. LAT. *Radix serpentum*.) is not at present much known in the shops. The Indians are said to prevent the otherwise fatal effects of the bite of a rattle-snake, by giving it internally, and applying it to the wound. It is likewise said to have been of extraordinary service in the rheumatism, and other disorders arising from the viscosity of the blood, as well as in pleurisies, and other inflammatory disorders. This root is a species of *contrayerva*.

SNAKE-ROOT, Virginian, (GER. *Virginische schlangenuwurzel*, *Giftwurzel*. DU. *Virginische slangenuwortel*. DA. *Slangeurtrod*. SW. *Virginsk ormerot*. FR. *Serpentaire*, *ou coluvrine de Virginie*. IT. *Serpentaria di Virginia*. SP. *Serpentaria de contrayerva de Virginia*. PORT. *Serpentaria de Virginia*. LAT. *Serpentaria Virginia*, *Contrayerva Virginiana*.) a medicinal root of a very singular figure, being wholly made up of a multitude of long and thin filaments, arranged in clusters together. It is to be chosen in large fibres, clean, of a brown colour, tough, and free from dirt, or other foreign matter. This root is supposed to be good as a remedy against the bites of venomous animals, and is considered a diuretic, diaphoretic, and alexipharmic. It grows principally in Virginia in North America, whence its denomination.

SNOW, a sort of trading vessel, with two masts; one of which, the sternmost, is shorter than the other.

SNUFF, (GER. *Schnupftaback*. DU. *Snuiftabak*. DA. and SW. *Snus*, *Snustobak*. FR. *Tabac en poudre*. IT. *Tabacco da naso*. SP. *Tabaco de polvo*. PORT. *Tabaco em po*. RUS. *Nosowoi tabak*. POL. *Proszek*.) a powder chiefly made of tobacco, the use of which is so universally known as to need no description here.

Although tobacco is the usual basis of snuff, yet other matters are sometimes added, to give it an agreeable flavour and scent, to suit the peculiar palates and fancies of the several takers. Many are the names which the venders of this article have in-

vented; and every day is adding to the catalogue.

It will be sufficient therefore to say, that there are three classes of snuffs, under which all the rest may be placed, viz. 1. *granulated*; 2. an *impalpable powder*; 3. the *bran*, or coarse parts remaining after the second sort has been sifted.

How to reduce Tobacco into Powder.

Uncord the tobacco, and spread the leaves on a carpet, to dry in the sun. Then pound them in a mortar, and sift through a coarse sieve, to get the coarsest powder out of it. As for sifting, you must observe to do it in due proportion as you pound it, and not to pound much at a time. You may also take another method, that of grinding it in one of those small mills which are made on purpose for grinding tobacco. By these means you may, without much trouble, make it as coarse or as fine as you like, by screwing the nut tighter, or slacker.

Large quantities of snuff are made both in Scotland, and Ireland, a great part of which is brought into this country for sale. The Irish snuff is prepared by toasting the tobacco, previously to the grinding, and not only the leaves but the *stalks* of the plant are ground up in the course of the process. Hence it is that the Irish snuff has obtained the appellation of *stalk*.

SOAP, (GER. *Seife*. DU. *Zeep*. DA. *Sæbe*. SW. *Tvål*. FR. *Savon*. IT. *Sapone*. SP. *Jabon*. PORT. *Sabão*. RUS. *Miilo*. POL. *Mydło*. LAT. *Sapo*.) an unctuous kind of paste, made with oil or other kinds of fat, and an alkali, sometimes actuated with quick-lime. The greatest quantities of soap are made in Spain, Portugal, France, and Italy; olive-oil being in those countries most plentiful. The process of making soap, as pursued by our manufacturers, is this:

A quantity of soda is pounded, and mixed in a wooden vessel, with about a fifth part of its weight of lime, which has been slacked and passed through a sieve immediately before. Upon this mixture a quantity of water is poured, considerably more than what is sufficient to cover it, and allowed to remain on it for several hours. The lime attracts the carbonic acid from the soda, and the water becomes strongly impregnated with the pure alkali, which in that state is caustic. This water is then drawn off by means of a stop-cock, and called the first ley.

Another quantity of water is then to be poured upon the soda, which, after standing two or three hours, is also to be drawn off by means of the stop-cock, and called the second ley.

Another portion of water is poured on; and after standing a sufficient time, is drawn off like the other two, and called the third ley.

Another portion of water may still be

poured on, in order to be certain that the whole of the soda is dissolved; and this weak ley may be put aside, and employed afterwards in forming the first ley in subsequent operations.

A quantity of oil, equal to six times the weight of the soda used, is then to be put into the boiler, together with a portion of the third or weakest ley; and the mixture must be kept boiling and agitated constantly by means of a wooden instrument. The whole of the third ley is to be added, at intervals, to the mixture; and after it is consumed, the second ley must be added in the same manner. The oil becomes milky, combines with the alkali, and after some hours it begins to acquire consistence. A little of the first ley is then to be added, not forgetting to agitate the mixture constantly. Portions of the first ley are to be added at intervals; the soapy substance acquires gradually greater consistency, and at last it begins to separate from the watery part of the mixture.

A quantity of common salt is then to be added, which renders the separation much more complete. The boiling is to be continued still for two hours, and then the fire must be withdrawn, and the liquor must be no longer agitated. After some hours' repose, the soap separates completely from the watery part, and swims upon the surface of the liquor. The watery part is then to be drawn off; and as it contains a quantity of carbonat of soda, it ought to be reserved for future use.

The fire is then to be kindled again; and, in order to facilitate the melting of the soap, a little water, or rather weak ley, is to be added to it. As soon as it boils, the remainder of the first ley is to be added to it at intervals. When the soap has been brought to the proper consistence, which is judged of by taking out small portions of it and allowing it to cool, it is to be withdrawn from the fire, and the watery part separated from it as before. It is then to be heated again, and a little water mixed with it, that it may form a proper paste. After this, let it be poured into the vessels proper for cooling it; in the bottom of which there ought to be a little chalk in powder, to prevent the soap from adhering. In a few days, the soap will have acquired sufficient consistence to be taken out, and formed into proper cakes.

The use of the common salt in the above process is, to separate the water from the soap; for common salt has a stronger affinity for water than soap has.

Olive-oil has been found to answer best for making soap, and next to it perhaps tallow may be placed; but a great variety of other oils may be employed for that purpose, as appears from the experiments of the French chemists. They found, however, that linseed-oil, and whale-oil, were not proper for making hard soaps, though they

might be employed with advantage in the manufacture of soft soaps. Whale-oil has been long used by the Dutch for this last purpose.

Soap may also be made without the assistance of heat; but in that case a much longer time and a larger proportion of alkali are necessary.

Manufacturers have contrived various methods of sophisticating soap, or of adding ingredients which increase its weight without increasing its value. The most common substance used for that purpose is water; which may be added in considerable quantities, especially to soap made with tallow (the ingredient chiefly used in this country), without diminishing its consistency.

Soap, made with tallow and soda, has a white colour, and therefore known by the name of *white soap*; but it is usual for soap-makers, in order to lower the price of the article, to mix a considerable portion of rosin with the tallow; this mixture forms the common *yellow* or *turpentine soap*.

The process above described is that followed in the manufacture of *hard soap*; in making *soft soap*, potash is substituted for the soda; the rest of the process is precisely the same as that of which we have been treating. *Mottled soap* obtains its speckled appearance by dispersing the ley, towards the end of the operation, through the soap, or by adding to it a quantity of sulphate of iron. Some manufacturers use the oxide of manganese for the same purpose.

Soap is subject to the laws of excise, and the maker for sale to the necessity of taking out an annual licence with a duty of 4*l*. Soap imported is subject to the duty of customs, and exported entitled to drawback. See 56 Geo. 3. c. 44.

SOAP-EARTH, a species of fossil, which abounds in Devonshire, Cornwall, and some other counties, and the islands in the vicinity of the Lizard point: it is generally of a white, or grey, colour, intermixed with greenish, or yellowish, shades, is composed of very fine particles, of a firm, equal, and regular texture, and is very heavy; its surface is smooth and glossy; it feels soft and greasy, and neither melts in the mouth, adheres to the tongue, nor stains the fingers.

This mineral may be formed into a paste with water, which is easily worked on the potter's wheel; and if thus manufactured it be exposed to an intense heat, it becomes so hard as to emit fire when stricken against steel.

This soap-earth possesses similar properties with fullers' earth, and is employed for the purpose of cleansing woollen cloths from grease; it does not, however, work so easily as clays; and, when, digested with vitriolic acid, it forms a salt somewhat resembling that obtained by evaporating Epsom water.

SOCOTRINE ALOES. (GER. *Sucotrina*loe. Du. *Sucotrina*loë. DA. and Sw.

*Sokotrina*loë. FR. *Aloes succotrin*, ou *chicotin*. It. *Aloë succotrin*o. Sp. *Acibar cicotrin*o. PORT. *Azevre succotrin*o. LAT. *Aloe sucotrina*.) See ALOES.

SODA, is an alkaline salt, principally obtained from the ashes of marine plants. For this purpose considerable quantities of sea-weeds are collected on the coasts of Scotland, and Spain, particularly, and burnt for the manufacture of what is called *barilla*, and *kelp*, both which are soda, mixed with a variety of extraneous substances. Soda, called also *natron*, may also be obtained from sea-salt, which consists principally of muriate of soda. It is also found in considerable quantities, combined with carbonic acid, in the natron beds of Egypt, and in the East Indies. When in a state of purity, it has a highly acrid, caustic taste, and quickly destroys animal substances. It is readily soluble in water, and rapidly absorbs the carbonic acid from the atmosphere, forming with it a mild neutral salt. It is difficult to distinguish pure soda, from pure potash; the most ready way is to add a little oxalic acid to them: this with potash forms a very soluble salt, but with soda, a salt soluble with great difficulty.

Soda is used by glass-makers, soap-makers, dyers, calico-printers, colour-makers, and is also employed in chemistry and medicine.

By 57 Geo. 3. c. 49. no maker of soda, or any alkaline preparation containing soda, according to the directions prescribed by the pharmacopœias of the Royal College of Physicians of London, Edinburgh, or Dublin, not exceeding 10 cwt. in any quarter of a year, shall be subject to the ordinary periodical surveys of the officers of excise, or to the several regulations on the time and manner of making alkali contained in this, or any other act of parliament, provided such maker shall make due entry of his works, and shall on, or within ten days after, the 5th of January, 5th of April, 5th of July, and 10th of October in every year, make a return in writing to the commissioners of excise, at the chief office, or to the collector, in whose collection his entered works shall be, of the whole quantity of soda and alkaline preparations containing soda sold by him in the quarter preceding, and verify the same by oath or affirmation, and shall thereupon pay to such commissioners, or collectors, the full duty on the quantity mentioned in such account, and according to the rate of thirty shillings per ton. § 28.

SODIUM is the metallic base of soda. It possesses many of the properties of potassium, (see POTASSIUM,) but it has a somewhat greater specific gravity, is fusible at 180° of Fahrenheit, and requires a strong red heat to reduce it to vapour. It has not been employed in the arts.

SOL, or **SOU**, a small copper money of France, equivalent to $\frac{1}{2}$ d. sterling. The

sol forms the basis of the values of the several copper, and silver, sol-pieces current in the French empire, an enumeration of which will be found under the article MONEY. In the French West Indies the copper sol is estimated at $\frac{1}{320}$ *l.* sterling. In Switzerland there is an imaginary specie called the sol, which, at Bern, &c. is reckoned at $1\frac{1}{2}$ *s.*; and at St. Gall, &c. at $1\frac{1}{2}$ *s.* English currency.

SOLDER, SODDER, or SODER, a metallic composition, used in soldering, or joining, other metals. Solders are made of gold, silver, copper, tin, bismuth, and lead; usually observing, that, in the composition, there shall be some of the metal that is to be soldered, mixed with some higher and finer metals. Goldsmiths usually make four kinds of solder, viz. solder of eight, where to seven parts of silver, there is one of brass or copper; solder of six, where only a sixth part is copper; solder of four, and solder of three. It is the mixture of copper in the solder, that makes raised plate come always cheaper than flat.

As mixtures of gold with a little copper are found to melt with less heat than pure gold itself, these mixtures serve as solders for gold: two pieces of fine gold are soldered by gold that has a small admixture of copper; and gold alloyed with copper is soldered by such as is alloyed with more copper. The workmen add a little silver, as well as copper, and vary the proportions of the two to one another, so as to make the colour of the solder correspond as nearly as may be to that of the piece. A mixture of gold, and copper, is also a solder for fine copper, as well as for fine gold. Gold being particularly disposed to unite with iron, proves an excellent solder for the finer kinds of iron, and steel, instruments.

The solder used by plumbers is made of two pounds of lead to one of block-tin. Its goodness is tried by melting it, and pouring the size of a crown piece on the table; for, if good, there will arise little bright shining stars in it. The solder for copper is made like that of the plumbers, only with copper and tin; and for very nice works, instead of tin, they sometimes use a quantity of silver. Solder for tin is made of two-thirds of tin, and one of lead, or of equal parts of each; but where the work is any thing delicate, as in organ-pipes, where the juncture is scarcely discernible, it is made of one part of bismuth, and three parts of pewter. The pewterers use a kind of solder made with two parts of tin, and one of bismuth; this composition melts with the least heat of any of the solders.

Silver solder is that which is made of two parts of silver, and one of brass, and used in soldering those metals. Spelter solder is made of one part of brass, and two of spelter, or zinc, and is used by the braziers and copper-smiths for soldering brass, copper,

and iron. This solder is improved by adding, to each ounce of it, one penny-weight of silver; but as it does not melt without a considerable degree of heat, it cannot be used when it is inconvenient to heat the work red-hot; in which case copper, and brass, are soldered with silver.

SOLDERING, the joining, and fastening together, of two pieces of the same metal, or of two different metals, by the fusion, and application, of some metallic composition on the extremities of the metals to be joined. To solder upon silver, brass, or iron: take silver, five penny-weights; brass, four penny-weights; melt them together for soft solder, which runs soonest. Take silver, five penny-weights; copper, three penny-weights; melt them together for hard solder. Beat the solder thin, and lay it on the place to be soldered, which must be first fited, and bound together, with wire, as occasion requires; then take borax in powder, and temper it like pap, and lay it upon the solder, letting it dry; then cover it with live coals, and blow, and it will run immediately; take it presently out of the fire, and it is done. It is to be observed, that if any thing is to be soldered in two places, which cannot well be done at one time, you must first solder with the harder solder, and then with the soft; for, if it is first done with the soft, it will unsolder again before the other is softened. Let it be observed, that if you would not have your solder run about the piece that is to be soldered, you must rub such places over with chalk. In the soldering either of gold, silver, copper, or either of the metals above mentioned, there is generally used borax in powder, and sometimes rosin. As to iron, it is sufficient that it be heated red-hot, and the two extremities thus hammered together, by which means they will become incorporated with each other. For the finer kinds of iron, and steel, instruments, however, gold proves an excellent solder. This metal will dissolve twice or thrice its weight of iron in a degree of heat very far less than that in which iron itself melts; hence, if a small plate of gold is wrapped round the parts to be joined, and afterwards melted by a blow-pipe, it strongly unites the pieces together, without any injury to the instrument, however delicate.

SOLDI, an Italian copper coin, equivalent to $\frac{3}{4}d.$ sterling.

SOLDO, a silver coin of Spain, worth $5\frac{1}{2}d.$

SOOCO, a silver money of the East Indies, current at 1*s.* 5*d.* British.

SOUCHONG TEA, a species of bohea tea. *See* TEA.

SOUNDING, at sea, the act of trying the depth of the water, and the quality of the bottom, by a line and plummet, or other artifice.

SOU. *See* SOL.

SOUTH-SEA COMPANY. *See* **tile COMPANY.** Also, stat. 55 Geo. 3. c. 57. and 56 Geo. 3. c. 77.

SOUTH WALES, *New*; that portion of New Holland already colonized by the English government. The following accounts respecting this interesting division of the terraqueous globe, at the conclusion of the year 1817, may not be unacceptable:

Exports:—oil, fur, seal-skins, and wool, and some horned cattle, to the Isle of France.

Population—in South Wales - 17,165
Van Diemen's Land 3,214

SOW, in the iron-works, the name of the block or lump of metal they work at once in the iron-furnace. The size of these sows of iron is very different, even from the same workmen, and the same furnace. These furnaces having sand-stones for their hearths and sides, up to the height of a yard, and the rest being made of brick, the hearth by the force of the fire is continually growing wider, so that if it at first contains as much metal as will make a sow of six, or seven, hundred weight, it will at last contain as much as will make a sow of 2000 weight.

SOY, an extract from a sort of bean growing in China, introduced into Europe by the Dutch. It is in great request as a stimulant sauce. The genuine soy, when shaken in a glass vessel, leaves a coat of a yellow-brown colour on the sides of it. It is imitated in England by boiling strong purl down to half its quantity, and infusing in it red herrings, anchovies, Spanish juice, and garlick, in certain proportions.

SPAN, a measure taken from the space between the thumb's end, and the tip of the little finger, when both are stretched out. The span is estimated at three hands' breadths, or nine inches.

SPANISH BROWN. *See* **BROWN.**

SPANISH FLIES. *See* **CANTHARIDES.**

SPANISH JUICE. *See* **LICORICE.**

SPANISH LEATHER. *See* **MO-ROCCO.**

SPANISH RED. *See* **REDO OCHRE.**

SPANISH WEED. *See* **ORCHILLA.**

SPAR, the ponderous *barytes*, or heavy earth, a name given to a fossil naturally combined with the sulphuric or carbonic acids, and found in different parts of England,

particularly in the counties of York, and Derby.

This mineral is manufactured into vases, and other ornaments for chimney-pieces.

Abundance of spar-ornaments, of various kinds, are manufactured in Derbyshire.

SPARS, (*GER.* *Sparren, Spieren.* *DU.* *Spieren.* *DA.* *Spiren.* *SW.* *Spirar, Bommar.* *FR.* *Espars.* *IT.* *Percie.* *SP.* *Berchas.* *PORT.* *Berchas, Vergontas,*) are small beams, formed from various sorts of wood, especially fir and oak, which are employed as yards for ships, as well as for sundry purposes, in the construction of buildings. These articles are, for the most part, imported from the Baltic, and North America.

SPARTA, or **SPARTO GRASS,** a species of fibrous plant, or junk, which grows abundantly upon the sea-shore in Spain, as well as in Provence, Languedoc, and some other provinces of France. It is employed not only in the manufacture of ropes, but in that of mats, and a sort of carpet, which is looked upon in France as being extremely ornamental to a room.

SPELTER. *See* **ZINC.**

SPERMACETI, (*GER.* *Wallrath.* *DU.* *Walschot.* *DA.* *Hvalraa.* *SW.* *Valratt, Valraf.* *FR.* *Blanc de Baleine, Sperme de Baleine.* *IT.* *Spermaceti.* *SP.* *Esperma de Calena, Espermaceti, Blanco de Ballena.* *PORT.* *Espermaceti.* *RUS.* *Spermazet.* *POL.* *Spermaceti, Olbrod.* *LAT.* *Spermaceti,*) the brain of a species of whale, purified from the oily matter, affords a fat of a singular kind, known in the shops by the improper name of spermaceti.

The spermaceti whale, *physeter*, called by the English sailors employed in the Greenland-fishery, *torump, jubbart, or gibbart*, is smaller than the common whale, but the head is proportionably much larger, amounting to above one-third the bulk of the whole body. He is furnished with teeth, which the other is not; and wants the flexible bones in the mouth, called whale-bone, which the other has. The throat is also remarkably wider.

One of these fishes affords some tons of brains, which are first grossly freed from the oil, by draining, and pressing, and afterward more perfectly purified, by steeping them in a ley of alkaline salt, and quicklime, which dissolves the remains of the oily matter into a saponaceous liquid. The brains, being then washed with water, appear of a silver whiteness; and nothing more is required to complete the preparation, than to cut them in shivers with wooden knives, and spread them abroad to dry. Such is the simple process by which this profitable commodity is prepared. It has been said, that spermaceti is a natural concrete, found floating on the surface of the northern seas; but this is a false report.

Good spermaceti is in fine white flakes,

glossy, and semi-transparent, soft, and unctuous to the touch, yet dry, and easily friable, in taste somewhat like butter, of a faint smell, like that of tallow.

Beside the use of spermaceti in medicine, it is employed for making candles, which are of a beautiful colour, and appear to be a medium between wax, and tallow, with respect to the advantages derived from a slender wick.

SPICES. (GER. *Spezereyen*. DU. *Speceryen*. DA. *Specerie*, *Krydderie*. SW. *Speceri*, *Kryddor*. FR. *Epicerie*, *Epices*. IT. *Spezj*, *Spezierie*. SP. *Espicias*, *Espicerias*. PORT. *Especies*, *Espiciaria*. RUS. *Prünie korenja*. POL. *Korzenie*.) Under this denomination, are included all those species of vegetable production, which are fragrant to the smell, or pungent to the palate; such as cloves, ginger, nutmegs, allspice, &c. &c. These will be found under their proper heads.

SPIKENARD. See **NARD.**

SPIKE-OIL, (GER. *Spiköl*. DU. *Spyköl*. DA. *Spikolje*. SW. *Spikolja*. FR. *Huile d'aspic*. IT. *Olio nardino*. SP. *Aceite de espliego*. PORT. *Óleo de espique*. LAT. *Oleum spicæ*.) is the same with oil of aspic. See **ASPIC.**

SPINDLE, in the sea language, is the smallest part of a ship's capstan, which is betwixt the two decks. The spindle of the jeer capstan has whelps to heave the viol.

The axis of the wheel of a watch, or clock, is also called the spindle.

Among miners the spindle is a piece of wood fastened into either stow blade.

SPINNING, the art of reducing silk, flax, hemp, hair, wool, or other matter, into thread. Spinning is either performed on the wheel, or with a distaff, and spindle, or with other machines proper for the several kinds of working. Hemp, flax, nettle-thread, and other like vegetable matters, are to be wetted in spinning: silks, wools, &c. are spun dry, at least they do not stand in need of water; there is, however, a way of spinning, or reeling, silk as it comes off the cases or balls, where hot, and even boiling water is to be used. The vast variety and importance of these branches of our manufactures which are produced from cotton, wool, and flax, spun into yarn, together with the cheapness of provisions, and the low price of labour, in many foreign countries, which are the rivals of our trade, have occasioned many attempts at home to render spinning more easy, cheap, and expeditious. Mr. Arkwright carried the invention to a high degree of perfection; and every day adds some ingenious improvement to the machinery.

SPIRIT OF WINE, (GER. *Weingeist*, *Spiet*. DU. *Wynggeist*, *Spiet*. DA. *Vingeist*. SW. *Vinspirit*. FR. *Esprit de vin*. IT. *Spirito di vino*. SP. *Espíritu de vino*. PORT. *Espírito de vinho*. RUS. *Wodka*.) is

nothing more than brandy distilled a second time; and this after another rectification, is called *spirit of wine rectified*. The spirit of wine is useful for several purposes, especially in the hardware manufactures. See title **ALCOHOL.**

SPIRITS. All inflammable liquors, raised by distillation, are included under this general denomination; such as brandy, rum, geneva, &c. which will be found under their proper heads. The importation of all spirits is subject to the laws of customs, as the sale, moving, &c. of them are to those of excise. The strength of them is regulated by 48 Geo. 3. c. 119., and the mode of ascertaining it by 56 Geo. 3. c. 140. For the different processes pursued in order to the producing spirituous liquors, see **DIS-TILLATION.**

SPLICING, in the sea language, is the untwisting the ends of two cables or ropes, and working the several strands into one another by a fidd, so that they become as strong as if they were but one rope, &c.

SPONGE, (GER. *Schwamm*, *Saugeschwamm*, *Badeschwamm*. DU. *Spongie*, *Spons*. DA. and SW. *Swamp*. FR. *Eponge*. IT. *Spugna*. SP. *Esponja*. PORT. *Esponga*. RUS. *Guba grezkaja*. POL. *Gebka*. LAT. *Spongia*.) a plant of very irregular figure, generally to be met with in the shops in pieces only. Its texture is cavernous, and porous; its great elasticity, and its property of imbibing, and as readily parting with, a large quantity of water, render it useful. Sponge is to be chosen as light as possible, perfectly clean, and free from stone; of as pale a colour as may be, with small holes, and fine, and soft, to the touch. The greatest part of the sponge we use, is brought from Aleppo, and Smyrna. It grows in the Archipelago, at considerable depths, on the rocks about some of the islands there, and multitudes of people make a trade of diving for it. It is also common in the Mediterranean, and many other seas, though in general browner, or yellower, and not so fine as that of the Archipelago. It adheres in large masses to rocks and stones, sometimes to large shells, and is either round, flat, or hollow, like a funnel.

SPOONING, in the sea language, is said of a ship, which being under sail in a storm at sea, is unable to bear it, and is consequently forced to put right before the wind.

SPRATS. See **SARDINES.**

SPRING, in mechanics, denotes a thin piece of tempered steel, or other elastic substance, which, being wound up, serves to put several machines in motion by its elasticity, or endeavour to unbend itself; such is the spring of a clock, watch, &c.

The spring of a lock, gun, or pistol, is a piece of steel, violently bent; which, being set at liberty, beats back the bolt of the lock, or strikes down the cock.

SPRINGING OF A MAST, in the sea language, is when it cracks, but is not broken in any part of it; as the partners, hounds, &c.

SPRIT-SAIL, of a ship, is the sail which belongs to the bowsprit.

SPRUCE BEER, a cheap and wholesome liquor, which is thus made: Take of water sixteen gallons, and boil the half of it. Put the water thus boiled, while in full heat, to the cold part, which should be previously put into a barrel or other vessel; then add sixteen pounds of treacle or molasses, with a few table-spoonfuls of the essence of spruce, stirring the whole well together; add half a pint of yeast, and keep it in a temperate situation, with the bung-hole open, for two days, till the fermentation is abated. Then close it up, or bottle it off, and it will be fit for being drunk in a few days afterwards. In North America, and perhaps in other countries, where the black, and white, spruce-firs abound, instead of adding the essence of the spruce at the same time with the molasses, they make a decoction of the leaves and small branches of these trees, and find the liquor equally good. It is a powerful antiscorbutic, and very useful in long sea voyages.

SPRUCE-ESSENCE, or **AMERICAN BEER ESSENCE**, is extracted from the sprigs of young branches of several North American fir trees, particularly of the black Canadian fir.

SPUNGE. See **SPONGE**.

SPUNGING, in the cloth trade, is the damping of woollens, in order to free the surface of the stuff from an unpleasant gloss.

SQUILL, (GER. *Meerzwiebel*. DU. *Zee-auijn*, *Squille*. DA. *Skille*, *Strandlögrod*. SW. *Skilla*, *Hafslök*. FR. *Scille*, *Oignon marin*. IT. *Scilla*, *Cipolla marina*. SP. *Cebolla albarana*. PORT. *Cebola alvarrã*. RUS. *Luk morskii*. POL. *Cebula zamorska*. • LAT. *Scilla*, *Squilla*.) or, as it is sometimes denominated, the sea-onion, is a plant, with a large, bulbous root; from which rise, first a naked stalk, bearing several hexapetalous white flowers, and afterwards large, green, lily-like leaves, with a remarkable rib in the middle of each. It grows spontaneously on sandy shores, in Spain, and in the Levant; whence we are annually supplied with the roots. They should be chosen large, plump, fresh, and full of a clammy juice: some are of a reddish colour, and others white; but no difference is observed in the qualities of the two sorts. To the taste this root is very nauseous, intensely bitter, and acrimonious; much handled, it ulcerates the skin. Taken internally, it serves as a powerful attenuant and aperient.

STAINING, in the manufactures, is the art of dyeing or tinging certain substances with different colouring matters. The following are the most approved modes of

staining the substances to which this operation is most commonly applied.

For the staining of wood, sharp corrosive fluids must be used, such as sulphuric acid, aquafortis, or a solution of sulphat of iron, or copper, according to the nature of the wood, or to the state into which it has been put by means of art.

Wood may be stained red, by previously soaking it in alum water, and then putting it into a decoction of Brazil wood, in lime-water. It may be made blue with a somewhat diluted solution of indigo in sulphuric acid. It assumes a green colour in a decoction of verdigris, sal ammoniac, and vinegar; black in a decoction of galls, logwood, sulphat of iron, filings of iron, and vinegar.

Quick lime slaked on common deal gives it a brown hue, more or less deep, according to the quantity and time it lies on; and this may be so managed as to make it finely veined. If, after this, it be well rubbed with linseed oil, in which alkanet has been boiled, and, lastly, varnished, it will make a very good imitation of mahogany. A solution of iron in aquafortis likewise makes a good stain for wood. So do gamboge and dragon's blood, dissolved in oil of turpentine.

For leather, on the contrary, these sharp corrosive substances must be avoided; because its durability will be destroyed by them. To give it a red colour, the skins, after being properly prepared, are dipped into a solution of tartar, and common salt, then put into a bath of madder, tartar, alum, and calcined oyster-shells, and sometimes also, at last, into a simple decoction of Brazil wood. Or the skins are steeped in alum-water, and afterward stained with a decoction of gum lac, Brazil wood, alum, and sal ammoniac. They acquire a blue colour by being rubbed over with a solution of indigo, and alum-water. They become yellow in a decoction of turmeric in lime-water; and green with sap-green dissolved in lime-water.

The above-mentioned baths may, in like manner, be used for horn, and ivory; beside which, the diluted solutions of mercury, iron, copper, and silver, may also be employed.

These latter liquors may likewise be laid upon all kinds of trinkets and toys made of agate. For the staining of marble, coloured resinous solutions in alcohol, or in ethereal oils, must be used; and, to promote the penetration of them into its substance, a little heat must be had recourse to. In the same manner, alabaster also may be stained with various colours, in particular red, with a decoction of Brazil wood, and alum; blue with elder-berries and alum; yellow with saffron, or turmeric, and other liquid colours of this kind. It is in a similar kind of staining, that the effects of common writing-ink consist.

STAMPS. As a mode of taxation, go-

vernment have enacted, that certain instruments shall not be valid, unless they are executed on paper bearing a stamp of a specified value, the imitation of which is punishable by death. These stamps are perpetually varying in amount, which may be ascertained from time to time by referring to any of the ephemeral Tables of Taxes. Stamps were first imposed for a revenue in the early part of the reign of William III. and the most recent statute of regulation is 55 Geo. 3. c. 184. The revenue arising from stamps for one year, was, Jan. 5. 1818, 6,549,808*l*.

STANDARD. Gold and silver manufactures are to be assayed by the warden of the goldsmiths' company, in London, and marked: and work of silver is to be as fine as sterling, excepting the solder necessary.

Gold plate, made by goldsmiths, shall contain twenty-two carats of fine gold; and silver plate eleven ounces, and two pennyweights, in every pound troy; and no goldsmith shall sell any such plate until marked with the initials of the maker's christian and surname.

All plate which, when assayed, is discovered to be of a coarser alloy than the standard, may be broken and defaced; and all persons making plate are to enter their marks, names and places of abode, in the assay office, under a penalty.

STANDING, in the sea-language. Standing part of the sheet, is that part of it which is made fast to a ring at the ship's quarter. Standing part of a tackle, is the end of the rope where the block is fastened. Standing ropes, are those which do not run in any block, but are set tawt, or let slack, as occasion serves; as the sheet-stays, back-stays, &c.

STAPLE signifies, primarily, a place of public sale, and even a town or city having such a place; and, secondarily, the principal goods brought to sale, or such as, not being liable to perish, are particularly adapted to be brought to the staple.

A *staple* article or commodity is synonymous with a *marketable* article.

Formerly there was a staple in this country, and a clerk of the staple, &c.; but this is now obsolete.

STARBOARD, the right-hand side of the ship.

STARCH. (GER. *Amidam*. DU. *Amydon*. FR. *Amidon*. DA. *Amdam*. SW. *Stärkelse*. IT. *Amidon*. PT. *Amido*. RUS. *Amidon*, *Almidon*. PORT. *Amido*. RUS. *Kruchmal*. POL. *Krochmal*. LAT. *Amylum*.) Starch may be made from a variety of articles: potatoes, in particular, will yield a reasonable quantity; but the labour of attending grinding, or grating them down, is considerable. When the potatoes are grated down, they do not require to be laid in steep to ferment, after the manner of flour, but must be immediately strained through a sieve; and if the potatoes are of a good

quality, the starch will settle to the bottom almost instantly; indeed, the operation of straining after the potatoes are grated down cannot be performed too quickly. The produce, however, even from the best, is far less than might be imagined.

Potatoe starch is not saleable in the shops, not having so long, and firm, a grain as starch from flour; but, if properly made, is preferable to all others for blue-makers, as it melts or dissolves so easily, and incorporates with the colour with far less trouble than any other substance whatever.

When starch is made from flour, the wheat is not ground so small, as when intended for sale, but ground with a broader flag or bran, as the meal, and starch are found to separate more readily from the bran. When laid in to steep, as much water must be used, as to wet completely the whole meal; in three, four, or five days, it will ferment, and in a few days more will settle, and all fermentation cease: after this, the stuff is fit to be what is called *washed out*.

The common time allowed to steep is from fourteen, to twenty days: as much depends on the temperature of the weather, the exact time cannot be ascertained; but it is much better to lie a few days longer, than to be washed out one day too soon. This operation is performed by the stuff being taken from the vats, and put into a strong round basket, which is set across a tub below a pump: one, or two, men keep going round the basket, stirring up the stuff with strong wooden shovels called *stirrers*, while another keeps pumping water till all the meal is completely washed from the bran, which is emptied into some convenient place to feed hogs: this operation is continued till the vats are emptied of the whole stuff, at the same time that it is strained through the basket into the tub underneath. As fast as the tub fills, it is taken out, and strained through hair-sieves, into what are sometimes called squares, by other frames. It is then suffered to rest twenty-four hours, when the water is drawn off the frame by plugs fixed at different depths. A thin stuff is then found to float above the starch, which is taken off by a tray made of a particular form for that purpose; this is called *slimes*, and is put into a cistern to feed hogs, by being mixed with the bran or grains: fresh water is then pumped into the squares, and the whole is wrought up with the stirrers, till it is completely incorporated with the water; it is then strained through a fine silk sieve, and suffered to rest and settle twenty-four hours, when the water is again drawn off, and some more slimes will be found floating, or at least in a loose and unsettled state, on the top of the starch; which being carefully removed, fresh water is again pumped on the starch, and the whole is wrought up as before; when it is again put into a silk sieve. It is now suffered

to rest for some days, — say four or five, — till the starch is once more settled, in a very firm state, at the bottom of the square. It is necessary to observe, if the starch is wanted to be what is commonly called Poland, that is, with the blue shade, during the last time of putting through the silk sieve, a certain quantity of the very best smalts must be mixed with the starch. If the smalts are very good, two pounds per hundred weight may do, and sometimes three pounds, according to the depth of blue wanted; if the best smalts are not used, however fine the colour may appear when in a damp state, it will entirely fly off in the stove, and leave the starch of a dingy hue.

When the starch is found to be completely settled, the water is again drawn off; and if any more slimes are still on the top, they are taken off as before, and the starch is now fit for boxing. It is necessary to observe, that the slimes taken off after the starch has been put through the silk sieve, are not put into the hog-wash, but are either mixed in some other operation, or again wrought up with water, and strained through the silk sieve; when a considerable part of them will be tolerably good starch.

The boxes may be made of different sizes; but they are commonly about four feet long, six inches deep, and twelve inches broad; they are bored full of holes, so that any remaining water may drain from the starch. Thin canvass is cut in such length, and breadth, as to line all the inside of the box, the intention of which is to bring the starch clean from the box after the water is fully drained.

The boxing is performed by digging the starch out of the square with a spade or shovel, and filling the boxes. The length of time for the starch being in the boxes can only be ascertained by the starch coming to a hard solid body, which is sometimes sooner, and sometimes longer. The starch is then taken from the boxes by turning them bottom uppermost on a table or dresser; it is then broken into pieces about four, or five, inches square, by laying a ruler, or round piece of wood, underneath the starch, giving the upper side a cut across with a knife; when a small press of the hand will break the starch into such pieces as are designed.

It is then set upon soft bricks, that is, bricks which have been only half burned in the kiln: the intention of this is to suck the water out of the starch; which, if not well done before putting into the stove, it will get *horny*, that is, the starch will be full of small pieces run together like pieces of horn, and will not dissolve afterwards: it is occasioned by the water drying, and incorporating with, the starch, which forms an insoluble substance; some starch-makers call it *cheesy*, as it likewise resembles the hard crust of Suffolk cheese, so that it will neither

answer for blue-makers, nor for the purpose of the laundry.

When sufficiently dried on the bricks, it is put into the stove (which is nearly the same as a sugar-baker's), where it remains some time: the duration must depend on the judgment of the maker, and the degree of heat in the stove. It is then taken out, and set on a table or dresser, when all the sides are carefully scraped or pared with a thin knife; after which, it is tied up in paper the same as we see it in the shops; when it is again returned into the stove, and continued with a regular heat, night and day, till completely dry: it requires some days, but the length of time can only be ascertained by an experienced maker.

It may be necessary to observe, that from the first laying in the meal to steep, till the last operation of taking from the stove to be weighed, the manufacture is constantly under the survey of one or more officers of excise.

Every maker of starch for sale, must take out an annual licence with a duty of 10*l*. Starch exported is allowed a drawback.

STARCH-BLUE. See **POWDER-BLUE.**

STATUTES of the *Realm* are, in colloquial language, generally denominated *Acts of Parliament*, and not unfrequently are so called even in legal proceedings, and referred to by the same in statutes themselves. The *Statute Law*, is a term used to signify such part of the law of the land as has been made by statutes still in being; in contradistinction to the *Common Law*, which latter consists of those ordinances which had so remote a commencement, that their origin is lost in antiquity.

Statutes passed *in pari materia*, (i. e. on the same subject, and for the same object,) though distant in time, are as much as possible to be construed as one; but on criminal subjects, where the punishment awarded by the posterior statute, is less severe than that of the anterior one, in favour of mercy, the latter is generally construed to restrain the severity of the preceding one. 2 *Dick. Pract. Expos.* 922.

STAVES. See **PIPE-STAVES.**

STAY, in the sea-language, a strong rope fastened to the top of one mast, and to the foot of that next before it, towards the prow, serving to keep it firm, and prevent its falling aftwards or towards the poop. All masts, topmasts, and flag-staves, have their stays, except the sprit-sail topmasts. That of the main-mast is called the main-stay. The main-mast, fore-mast, and those belonging to them, have also back-stays to prevent their pitching forwards or overboard.

STEAM-BOAT. The number of inventions, and improvements, which have met the public eye on this subject, within the few last years, would fill a volume, if amply detailed: that, however, being incompatible

with our purpose, we shall only observe, that hitherto, the discovery of the power of steam in this direction, has, in this kingdom, rather been applied to the locomotion of persons, than to the purposes of commercial intercourse. Steam-boats seem to be especially desirable for transit on the rivers of America, where water conveyance forms a characteristic feature of the country, and where immense journeys are to be performed through trackless wilds, to obtain easy communication between distant places. Accordingly, with the exception of some prior feeble attempts on the rivers of Scotland, these conveyances were first introduced into common use, and that on a large scale, and within our time, in America; viz. on the Ohio river: but the philosophers of that country have laid claim to the entire invention somewhat too precipitately; for, beside some earlier attempts in Scotland, to which we have alluded, by a patent of our King James I. granted to David Ramsay, and Thomas Wildgosse, we find, that a method of making boats "run upon the water in calms as fast, and in storms even faster, than boats full sailed in great winds," had been discovered by them. History does not inform us to what extent the experiment succeeded; but it seems a reasonable inference from the grant itself, that although much merit may be due to the practical application, an exclusive claim to the modern invention of a new theory on the subject, may perhaps be more problematical than has been suspected. There may indeed be some doubt whether steam was, or was not, the propelling power in the invention which was protected by the above-mentioned patent; but, as history is silent on this part of the subject, we are at least warranted in expressing a doubt whether it was not so.

The general construction of the steam vessel and its apparatus is as follows: the boat is long and narrow, with cabins at each end, and the engine in the centre between them. There is a projection along the sides, beyond the proper body of the vessel, and under them the paddle-wheels, which are somewhat like an undershot mill-wheel. These are kept in constant revolution by the machinery above. The boilers are of wrought sheet-iron, or of copper, and ought to be strong enough to resist the expansive force of the steam to twice, or three times, the amount of power in use; and having moreover valves so constructed, as easily to allow the escape of steam, without going through the engine, when the power of the steam within the boiler exceeds the maximum of working pressure. The engine is made on the condensing principle, feeds its own boiler, and pumps out any water in the vessel to such a degree, as to exceed the influx by any probable leak. If the qualities of the different parts of the machine be commensurate with the purposes to be performed, there

can be no possible risk, and the advantages of the steam vessel, when united with security, are too obvious to stand in need of panegyric.

The advance of steam-boats, as at present constructed, is rapid; but that rapidity would be much increased, if the resistance which the paddle-wheels meet with from the water, in performing one half of their revolution; or, in other words, if the boards attached to the wheels, by which the weight of water impels the vessel forward during their descent through one half of their revolution, could be made to effect such a change of their situation, as to meet with little or no resistance from the water during the other, or ascending half of their revolution. Such a project has been in contemplation. Steam vessels are now minutely regulated and duties imposed by several recent acts.

STEAM-ENGINE. See ENGINE.

STEEL, (GER. *Stahl*. DU. and DA. *Staal*. Sw. *Stål*. FR. *Acier*. IT. *Acciajo*. SP. *Acero*. PORT. *Aço*. RUS. and POL. *Stal*. LAT. *Chalybs*), is iron refined in the fire with certain ingredients, that render it white, and impart to it a harder, and finer, grain, than that of the original metal.

Iron is converted into steel, either by fusion, or cementation; the former method is employed for making steel immediately from the ore, or from the crude, cast metal; in the latter, bars of iron are placed in furnaces, with a stratum of charcoal between every two, till the pile is raised to a sufficient height; the whole is then closely covered to prevent the access of the air, when a strong fire is kindled, and uniformly continued during the whole process; the surface of the metal, manufactured in either way, generally exhibits numerous vesicles, whence it is called blistered steel; but these may be removed by repeated ignition between red-hot coals, and by forging.

The finest metal of this description is the Damascus steel, which is imported from Syria; but the process pursued in the Turkish manufactories is not accurately known in Europe: the German steel is made by breaking the blistered bars into small pieces, which are exposed to the strong fire of a furnace; these are next welded, and extended to the length of about eighteen inches, when they are doubled, welded the second time, and at length drawn to the requisite size and shape. The celebrated Brescian steel is obtained by roasting the iron-ore in strata, with layers of wood between; and when these are sufficiently smelted, the metal is taken out of the furnace, broken in pieces, picked, and washed in troughs of pure water; it is next conveyed to an oblong square cavity, termed the fluxing bed, which is strewn with a mixture of finely sifted ashes, and sand, that are carefully compressed; a stratum of charcoal is then laid on, the smelted metal is gradually added, and

at the end of three, or four, days the conversion is completed.

The best steel manufactured in Britain is known under the name of cast steel: it is prepared from the common blistered metal, which, being broken in pieces, is put into proper crucibles, with a flux; and, after the fusion is effected, the metal is cast into ingots, when it undergoes the operation of tilting, and is at length tempered by repeated heating, and immersion in water.

This useful article is subservient chiefly to the manufactures of sword-blades, knives, razors, and a variety of other utensils employed in the arts, and by mechanics.

STEEL-YARD, or STILYARD, (GER. Schnellwaage. Du. Weeghaak, Boerebalans. DA. Bismær. Sw. Pyndare. FR. Peson, Balance Romaine. IT. Stadera. Sp. Romana. PORT. Balança Romana. RUS. Besmân. POL. Przemian waga,) is one of the most simple machines for ascertaining the weight of bodies by counterpoise.

The steel-yard consists of a lever of unequal arms; and in its most perfect form is constructed on the principles of the usual balance, to which, however, it is greatly inferior in point of minute accuracy: on the other hand the steel-yard is more compendious and convenient, nor does it admit of those subtle frauds which are daily practised with scales.

STEERAGE, on board a ship, that part of the ship next below the quarter deck, before the bulk-head of the great cabin, where the steersman stands.

STEERING, in navigation, the directing of a vessel from one place to another, by means of the helm, and rudder. He is held the best steersman who causes the least motion in putting the helm over to and again, and who best keeps the ship from making yaws, that is, from running in, and out. There are three methods of steering; 1. By any mark on the land, so as to keep the ship even by it. 2. By the compass, which is by keeping the ship's head on such a rhumb, or point of the compass, as best leads to port. 3. To steer as one is bidden or conneed, which, in a great ship, is the duty of him that is taking his turn at the helm.

STEKAN, a liquid measure of Amsterdam.

STEM, of a ship, that main piece of timber, which comes bending from the keel below, where it is scarfed, as they call it, that is, pieced in; and rises compassing right before the fore-castle. This stem it is which guides the rake of the ship, and all the butt-ends of the planks are fixed into it. This, in the section of a first-rate ship, is called the main-stem.

STENCILLING PAPER-HANGINGS. The figure, which all the parts of any particular colour make in the design to be painted, is to be cut out in a piece of thin

leather, or oil-cloth, which pieces of leather, or oil-cloth, are called stencils; and being laid flat on the sheets of paper to be printed, spread upon a table, or floor, are to be rubbed over with the colour properly tempered, by means of a large brush.

The colour passing over the whole is consequently spread on those parts of the paper where the cloth, or leather, is cut away, and give the same effect as if laid on by a print.

This is, however, only practicable in parts where there are only detached masses, or spots of colours; for where there are small continued lines, or parts that run one into another, it is difficult to preserve the connection or continuity of the parts of the cloth, or to keep the smaller corners close down to the paper; in such cases, therefore, prints are preferable.

STEP of the mast and capstan, in a ship, is that piece of timber, whereon the masts or capstans stand at bottom.

STEREOTYPE PRINTING. The Chinese, and Japanese, first practised the art of printing by means of wooden blocks. The mode of stereotype printing is, first to set up a page, for instance, in the common way, and when it is rendered perfectly correct, a cast is taken from it, and in this cast the metal for the stereotype platé is poured. This, however, is a mode of printing more ingenious, than useful, for general purposes.

It may be useful for bibles, prayer-books, dictionaries, and school-books, which do not usually vary.

It is but justice, however, on this subject to observe, that an inconvenience in stereotype printing, arising from the uneven surface of the plates, which had been considered irremediable, has been removed by a recent invention, or adoption (we know not which) for casting plates of exactly equal thickness, by Mr. Ferguson of Newman-street, London.

STERLING, a term frequent in British commerce. A pound, shilling, or penny sterling, signifies as much as a pound, shilling, or penny, of lawful money of Great Britain, as settled by authority.

STERN of a ship, usually denotes all the hindmost part of her, but properly it is only the outmost part abaft.

STERN-FAST, denotes some fastenings of ropes, &c. behind the stern of a ship, to which a cable or hawser may be brought or fixed, in order to hold her stern to a wharf, &c.

STERN-POST, a great timber let into the keel at the stern of a ship, somewhat sloping, into which are fastened the after-planks; and on this post, by its pintle, and gudgeons, hangs the rudder.

STICK-LAC, (GER. Sticklack, Stocklack, Stangenlack. Du. Stoklak, Houllak. DA. Stoklak. Sw. Stocklack. FR. Lacque en bâtons. IT. Lacca in bastoncini. Sp. Laca en palillos. PORT. Laca em páos. LAT. Lacca in baculis, s. ramulis,) is the white membranous sub-

stance found in the cells of the insects that yield gum-lac, or the wax adhering to some of the small branches of the tree, on which these insects are found; being the exuviae of the young. See LAC.

STICKS, *Foot*, in printing, slips of wood that lie between the foot of the page, and the chase, to which they are wedged fast by the quoins, to keep the form firm, in conjunction with the side-sticks, which are placed at the side of the page, and fixed in the same manner by means of quoins.

STILL, the vessel employed in distilling spirituous liquors. See DISTILLATION and ALEMBIC.

STIRRUP of a ship, a piece of timber put upon a ship's keel, when some of her keel happens to be beaten off, and they cannot come conveniently to fit in a new piece; then they patch in a piece of timber, and bind it on with an iron which goes under the ship's keel, and comes up on each side of the ship, where it is nailed strongly with spikes, and this they call a stirrup.

STIVER, a copper coin current in Holland at 1*d.* and 1-20th sterling. There is a somewhat similar, though smaller copper money, of the same name, which passes in Sweden, at 7-18ths of a penny.

STOCK, a fund raised by a commercial company, or a principal sum or property in trade.

In book-keeping, *stock* denotes the owner or owners of the books.

STOCKS. See FUNDS.

STOCKINGS, (GER. *Strümpfe*. DU. *Koussen*. DA. *Strømper*. SW. *Strumpor*. FR. *Bas*. IT. *Calze*. SP. *Medias*. PORT. *Meias*, *Meas*. RUS. *Tschulki*. POL. *Ponczochy*.) the clothing of the leg and foot. Anciently the only stockings in use were made of cloth, or of milled stuffs, sewed together; but since the invention of knitting, and weaving, stockings of silk, wool, cotton, thread, &c. the use of cloth stockings is obsolete. The modern stockings, whether woven, or knit, are a kind of plexuses, formed of an infinite number of little knots, called stitches, loops, or meshes, intermingled with one another. Knit stockings are wrought with needles made of polished iron, or brass, wire, which interweave the threads, and form the meshes the stockings consist of. This operation is called knitting, the invention whereof is commonly attributed to the Scots, on this ground, that the first works of this kind came from Scotland. It is added, that it was on this account that the company of stocking-knitters established at Paris, in 1527, took for their patron St. Fiacre, who is said to be the son of a king of Scotland.

It is said that the invention of knit silk stockings first came from Spain. William Rider was the first person who made stockings in England, and he, we are told, learned the art at the house of an Italian merchant,

and knit a pair of worsted stockings, which he presented to William, Earl of Pembroke, in the year 1564. Woven stockings are at present manufactured on a machine made of finely polished iron, or steel. The structure of this machine is too complex for verbal description; we must therefore refer the curious, on this head, to the Cyclopedias, where the explanations are illustrated by engravings. The invention of the stocking loom is ascribed to William Lee, M. A. of St. John's College, Cambridge, so far back as the year 1589 by some; but by others to a student of Oxford. Since its first invention, the loom has of course received several improvements. By means of some additional machinery to the stocking-frame, the turned ribbed stockings are made, as well as those done with knitting-needles.

Nottingham and Leicester are the chief seats of the weave-stocking manufacture in this country. Knit-stockings are principally made in Scotland and Wales, and the northern counties of England.

STONE-WARE. (GER. *Steingut*, *Steinzeug*. DU. *Steengoed*. DA. *Steentij*. SW. *Stenkärl*, *Stenporcellän*. FR. *Gresserie*, *Poterie de grés*. IT. *Vassellame di pietra*. SP. *Loza de piedra*. PORT. *Louça de pedra*.) Under this denomination are comprehended all the different artificial combinations of earthy bodies, which are applied to useful purposes. See PORCELAIN and POTTERY.

STOOPEN, a liquid measure of Holland.

STORAX, (GER. *Storax*. DU. *Styrax*, *Storax*. DA. and SW. *Storax*. FR. *Styrax*, *Storax*. IT. *Storace*, *Stirace*, *Storax*. SP. *Estoraque*. PORT. *Estoraque*, *Storaque*. RUS. *Stirax*. POL. *Styrax*. LAT. *Styrax*, *Storax*.) the most fragrant of the solid resins, and indeed of all the known vegetable substances. It is obtained from a tree of the same name, said to grow most plentifully in Syria, Cilicia, and Pamphilia. America likewise produces storax-trees, but not that particular species which affords the official resin.

The fine storax, called red storax, or storax in the tear, is the pure native juice, flowing from incisions made in the trunk of the tree. This is very rarely to be met with. The common storax is supposed to be in part an artificial composition, mixed with a considerable portion of the genuine resin.

It seems probable, that the pure storax is the juice which concretes upon the tree, and which has lost in the drying its more subtle odoriferous parts; and that the common storax is the juice received immediately in vessels, and mixed with saw-dust enough to thicken it; the shops requiring, under the name of storax, a solid or consistent mass, and evaporation being found to dissipate its fragrance.

The storax-tree is said to grow spontaneously, not only in the eastern countries, but in Italy: whether it yields any resin there

we have no account. It scarcely bears the winters of our climate without shelter.

The common storax was formerly brought to us inclosed in reeds or canes, whence its name *styrax calamita*: at present we meet with it in large cakes or loaves, of a reddish brown colour, softish, and, as it were, unctuous to the touch, yet brittle and friable, and of an extremely pleasant sweet smell.

Though this odoriferous drug was formerly a familiar remedy, it has now no place in any of the officinal compounds, and its use seems to be limited to that of a perfume.

STORES. If any person who has the charge or custody of any of the king's armour, ordnance, ammunition, shot, powder, or habiliments of war, or of any victuals for victualling the navy, shall, to hinder his majesty's service, embezzle, purloin, or convey away the same to the value of 20s. or shall steal or embezzle any of his majesty's sails, cordage, or any other of his naval stores, to the value of 20s. he shall be adjudged guilty of felony without benefit of clergy. 31 Eliz. c. 4. and 22 Car. 2. c. 5.

Since those statutes, a prodigious number of others have been successively made on the same subject; 9 & 10 Will. 3. c. 4. and 41, confirmed and enlarged by 17 Geo. 2. c. 8, give justices the cognizance of these offences; and 4 Geo. 3. c. 30. extends it to the treasurer, comptroller, commissioners, and certain other officers of the navy. 39 & 40 Geo. 3. c. 89. prohibits any persons from being in possession of any stores of war or naval ordnance (except by authority under special circumstances) under penalty of transportation for 14 years. Then come statute 54 Geo. 3. c. 60. to extend the provisions of 9 & 10 Will. 3. and 39 & 40 Geo. 3. c. 89. to articles not comprised in the former ones; and 55 Geo. 3. c. 77. to extend them to all articles whatever under the care or controul of any officer in the service of his majesty, marked with any of the specified marks to denote their appropriation to the purposes of the navy, &c.—Lastly, 56 Geo. 3. c. 80. was passed to extend certain powers of the principal officers of the navy here, to those of a similar description resident in his majesty's foreign settlements.

STRANDED, among seamen, is said of a ship that is driven ashore by a tempest, or runs aground through ill steerage, and so perishes. Where any vessel is stranded, the justices of the peace are empowered to command the constables near the sea-coast to call assistance, in order to preserve the same if possible. See SALVAGE and WRECKS.

STRANDING of a ship. How it affects the insurer, and insured, in the marine law, &c. see INSURANCE, SALVAGE, &c.

STRAP, in a ship, is a rope spliced about

any block, or made with an eye to fasten it any where, on occasion.

STRAW-HATS. (GER. *Strohhiute*. DU. *Stroohoeden*. DA. *Halmhatte*. SW. *Halmhattar*. FR. *Chapeaux de paille*. IT. *Capelli di paglia*. SP. *Sombreritos de paja*. PORT. *Chapeos de palha*.) See HATS.

STRIKE, a dry measure, usually employed in selling corn, and containing two bushels.

STRIKE, among seamen, is a word variously used. When a ship, in a fight, or on meeting with a ship of war, lets down or lowers her top-sails, at least half-mast high, they say she strikes, meaning she yields, or submits, or pays respect to the ship of war. Also, when a ship touches ground, in shoal-water, they say she strikes. And when a top-mast is to be taken down, the word of command is, strike the top-mast, &c.

STUBGEN, a liquid measure of some parts of Germany.

STUCCO is a generic term, and comprehends all the different kinds of drawings or coverings or coatings for walls, outer, as well as inner; but by custom and habit we generally apply this generic appellation of stucco to one only of the numerous species exclusively; viz. to that coating or covering for inner walls which is a very fine-grained pargeting, susceptible of a fine polish, of a variety of colours, and highly ornamental for rooms. Those species of stucco which are designed for the outside walls of fabricks, and are intended to imitate, and give to them the appearance of, stone, are composed of materials somewhat differing from that which we have been describing, and also from one another; and have been distinguished by a great variety of appellations, as we shall notice hereafter.

Stucco, then, as we usually apply the word, viz. to the inside finishing of rooms, is properly a composition of white marble pulverised, and mixed with plaister, or lime, the whole being sifted, and wrought up together with water. But in general, gypsum carefully selected, and well burnt, is taken for this purpose, and a suitable proportion of joiner's glue is added, in beating it up into mortar, with the colour intended to be given it previously ground with water. When the coating of plaister laid on in the usual way is dry, it may be polished, by rubbing first with pumice-stone, then with a whet-stone, and afterwards with tripoli. The last polish is given it by rubbing it with a piece of felt, or old hat, wetted with soap-suds, and afterwards with oil.

We now come to give some account of those species of stucco which have been usually applied to the outsides of fabricks, to give them the appearance of stone. We shall only notice those of somewhat recent date with any degree of particularity; although these have been distinguished by a great variety of appellations, some derived

from the names of the inventors, others from real, or supposed, resemblances to anterior discoveries in other countries, as, for example, Wark's, Emerton's, Rawlinson's, Semple's, Liardot's, Adams's, Loriot's cements, and others, of the former description; and of the latter, Tunisian cement, Dutch terras, Tournay cement, Roman cement, Grecian maltha, or Chio mastich, Tunisian mortar, Indian chunem, and others. Of all these, however distinguished by origin, or appellation, lime, and sand, mixed up with some fluid, as oil, milk, mucilage, water, &c. form the bases. On the characteristic quality of the lime, and of the sand, in a great degree depend the hardness and durability of the stucco; on the proper proportions of them respectively, also much; and on the tenacity of the fluid, something. Respecting the sorts of lime (of which there are innumerable varieties) best suited for the purpose of composing durable stucco, there seems still to be some difference of opinion among chemical enquirers; but one thing, at least, may without hazard be advanced; viz. that the soft chalky lime is the worst, and that the hard brown limes, if pure from a mixture of clay, are the best. Of sand, a proper selection is of the highest importance, as the sharper, and coarser, it is the better. The saline particles of sea sand render it highly objectionable, and the mixture of clay in much of the common pit-sand makes it scarcely less so. Neither of them can be even amended, but by washing to an extreme that cannot be encountered with convenience. Of the fluids which have been in use for the purpose of cementing the dry materials into a paste, oil, and water, have been the most common, and are indeed the only ones worth noticing; for milk, eggs, dissolved gums, blood, &c. &c. all of which have had their advocates, are inapplicable to fabrics upon a large scale.

Liardot's, Adams's, and some other compositions, which for a considerable period of the last century were in most esteem, were composed of the following ingredients, and all in nearly the following proportions: lime calcined and pounded 21 lb., oil 4 quarts, beer measure, mixed and beat up with 28 quarts of sand, beer measure.

The *Tunisian cement* is composed of three parts of lime, one of sand, and two of wood-ashes, and these ingredients are mixed up with oil, and water, alternately till they compose a paste of the desired consistency.

Dutch Terras is composed of basalt ground to a fine powder, and blue argillaceous lime, mixed up with water, and well beaten together.

Tournay cement, called *cedrée de Tournay*, is a mixture of coal-ashes, with blue argillaceous lime, and sand, well beaten up with water, left to dry, repeatedly levigated, moistened, and beaten.

The genuine *Roman cement*, it is no

longer a doubt, consisted of the *pulvis Putcolanus*, now called *Puzzolene*, a ferruginous clay from Putcoli, calcined by the fires of Vesuvius, lime, and sand, mixed up with soft water. The only preparation which the *Puzzolene* underwent was that of pounding, and sifting; but they occasionally mixed up the ingredients with bullock's blood, and fat of animals, to give the composition more tenacity. It will be reasonably concluded, that the cements which have been recommended of late years under the title of Roman, have been imitations, more or less close, of this composition.

The *Maltha*, or *Mastich* of the Greeks, seems to have been a more simple composition than the cement of the Romans, when used for stucco on the outsides of fabrics, consisting only of lime, and sand, but rendered into a paste with milk, or some tenacious fluid of the kind which we understand by the term *size*.

The *Indian Chunem*, which is only a variety of the mastich, is composed of equal quantities of flint, lime, and pit-sand, slaked with water, well beaten, and suffered to remain for three, or four, days, then moistened and mixed up with oil, mucilage, whites of eggs, and butter-milk, and applied, as rapidly as possible, after being mixed.

The mastich stuccoes of the present day in this country derive their origin from those we have been describing, and are only variations of those compositions. The tenacity, and hardness, are much increased by an attention to the flinty quality of the lime, and by the continual addition, to the mass of composition, of small portions of that ingredient in its quick, or unslaked state, finely levigated. It has been suggested, and with great plausibility, that nothing contributes more to the hardness, and durability, of this description of stucco, than the sweepings or scrapings from a high road composed of coarse gravel, being one of the constituent parts of the mixture. Nor is this extraordinary, for coarse gravel being generally only a collection of small flints, the dust arising from such a road is merely a species of very strong lime pulverised in its natural state, by the trituration of wheel-carriages.

STUM, in the wine trade, denotes the unfermented juice of the grapes, after it has been several times racked off, and separated from its sediment.

STYRAX. See STORAX.

SUBSCRIPTION is primarily a writing put at the bottom of any instrument, or document; and that writing is generally the name of the person making it, with any addition which the particular occasion calls for.

In commercial language, it is commonly used for the share or interest which particular persons take in a public stock or trading company, by writing their names, and the shares they require, in the books or registers of it.

In the commerce of *books* particularly, the word has another signification. It means, in that instance, an engagement to take a certain number of copies of a book going to be printed; and a reciprocal obligation of the publisher to deliver the said copies on certain terms. The usual conditions of these subscriptions are, on the part of the publisher, to deliver the books cheaper to the subscriber than to another, by one-third, or one-fourth, of the price; and on the part of the latter, to advance half the money in hand, and to pay the remainder on the delivery of the copies. There are other senses, in which the word subscription is frequently used, to signify assent to certain propositions, but even in those cases, that assent is manifested by the writing of the person's name. So that, in truth, only a transfer, as it were, of the term from the operation signifying the assent, to the assent signified thereby.

SUBTRACTION is the second rule in arithmetic, and consists in deducting a smaller number from a larger, in order to ascertain the difference.

SUFFERANCE, *estate at*, is where one comes into possession of a tenement by lawful title, but keeps it after the expiration of his term without any title. As, if one take a lease for a year, and, after the year is expired, continue to hold the premises without any fresh authority. This sort of estate, however, may be destroyed by the owner making an actual entry on the premises, and ousting the tenant; but before such entry, he cannot maintain an action of trespass against the tenant, as he might against a stranger. However, by 4 Geo. 2. c. 28., in case any tenant for life, or years, or other person claiming under, or by collusion with, such tenant, shall wilfully hold over after the determination of the term, and demand made in writing for recovering possession of the premises, by him to whom the remainder, or reversion, of them shall belong; such person shall pay for the time that he continues, at the rate of double the yearly value of the premises detained.

SUGAR, (GER. *Zucker*. DU. *Suiker*. DA. *Sukker*. SW. *Socker*. FR. *Sucre*. IT. *Zucchero*. SP. *Azucar*. PORT. *Assucar*. RUS. *Sachar*. POL. *Cukier*. LAT. *Saccharum*.) a solid, sweet substance, obtained from the sugar-cane; or, according to chemists, an essential salt, capable of crystallisation. It is of a sweet and agreeable flavour, and is contained, in a greater, or smaller, quantity, in almost every species of vegetable; but next to the sugar-cane is the American maple. The inhabitants of that country obtain it by boring a hole in the tree early in spring, from which issues a juice, from 20 quarts of which they get about a pound of sugar. The sugar of grapes has lately been made in France. This, as also that from the maple-juice, is produced by eva-

poration. The most abundant, however, is in the sugar-cane. It is cultivated with the greatest success in the East Indies, South America, and the West Indies.

The sugar-cane is a jointed reed, which terminates in leaves or blades, the edges of which are finely and sharply serrated. The body of the cane, though brittle, is strong, and, when ripe, is of a fine straw colour, inclinable to yellow. It likewise contains a soft pithy substance, which is replete with juice of a very agreeable taste. The general distance between each joint of the cane is from one to three inches in length, and from half an inch to an inch in diameter; and the general height (the flag part being excluded) is from three feet and a half, to seven feet. In very rich lands, too, the stool or root has been known to put forth upwards of one hundred suckers or shoots.

To bring a plant of this rank and succulent nature to perfection, no land can be too rich; and the ashy loam of St. Christopher's appears to be the best soil hitherto known, for the production of sugar of the finest quality, and in the largest proportion. The next to this in excellence is the soil which in Jamaica is called brick-mould. It is a deep, warm, and mellow hazel earth, which is easily worked, and which, in the wettest season, seldom requires trenching. In a very fine season, plant-canes (which are those of the first growth) have been known, in this soil, to yield two tons and a half of sugar per acre. The black mould of several varieties may be reckoned after this. The best is the deep black earth of Barbadoes, Antigua, and some other of the windward islands; but there is a species of this mould in Jamaica, that is perhaps not in the least inferior to it, which abounds with lime-stone, and flint, on a substratum of soapy marl. Black mould on clay is more common; and when properly pulverised and manured, becomes very productive, and may be said to be inexhaustible. But there are few soils that produce a greater return of refined sugar than a peculiar sort of land on the north side of Jamaica, and particularly in the parish of Trelawney. This land is generally of a red colour, is every where remarkable when first turned up for a glossy surface, and when wetted stains the fingers like paint. It appears to consist of a native earth or pure loam, with a mixture of clay and sand; and though deep, it is by no means heavy, and is naturally dry. Hence, as its fertility is destroyed when too much exposed to the burning influence of a tropical sun, the system of husbandry, where this soil abounds, chiefly depends on what is called ratoon canes. Ratoons are the suckers, that spring from the roots or stools of the canes that have been previously cut for sugar, and are generally ripe in twelve months. Plant-canes, or canes of the first

growth, are the immediate produce of the original germs placed in the ground, and require from fifteen, to seventeen, months to bring them to maturity. The first yearly returns from their roots are called first ratoons, the second year's growth second ratoons, and so on, according to their age. The common yielding too of this cane-land, on an average, is seven hogsheads of sixteen hundred weight to ten acres, which are cut every year.

Such planters as are not fortunately furnished with the means of grinding their canes by water, are at the cutting season frequently impeded by the failure or insufficiency of their mills; for though a sugar-mill is a very simple contrivance, yet great force is requisite to make it vanquish the resistance which it necessarily meets with. It principally consists of three upright iron rollers or cylinders, from thirty, to forty, inches in length, and from twenty, to twenty-five, inches in diameter; and the middle one, to which the moving power is applied, turns the other two by means of cogs. The canes, which are previously cut short, and tied into bundles, are twice compressed between these rollers; for after they have passed through the first, and second, rollers, they are turned round the middle one by a piece of frame-work of a circular form, which is called in Jamaica the dumb returner, and forced back through the second and third. By this operation they are squeezed completely dry, and sometimes even reduced to powder. The cane-juice is received in a leaden bed, and thence conveyed into a vessel called the receiver. The refuse, or macerated rind of the cane, which is called cane-trash, serves for fuel to boil the liquor.

The sugar is obtained by the following process: The juice or liquor runs from the receiver to the boiling house along a wooden gutter lined with lead. In the boiling house it is received into one of the copper pans or cauldrons called clarifiers. Of these there are generally three; and their dimensions are determined by the power of supplying them with liquor. There are water-mills that will grind with great facility sufficient for thirty hogsheads of sugar in a week. Methods of quick boiling cannot be dispensed with on plantations thus fortunately provided; for otherwise the cane liquor would unavoidably become tainted before it could be exposed to the fire. The purest cane juice will not remain twenty minutes in the receiver without fermenting. Hence, clarifiers are sometimes seen of one thousand gallons each. But on plantations that during crop-time make from fifteen, to twenty, hogsheads of sugar a week, three clarifiers of three, or four, hundred gallons each are sufficient. The liquor, when clarified, may be drawn off at once with pans of this size, and there is leisure to cleanse the vessels every time they are used. Each

clarifier is furnished either with a siphon, or cock for drawing off the liquor. It has a flat bottom, and is hung to a separate fire, each chimney having an iron slider, which, when shut, causes the fire to be extinguished through want of air.

As soon as the stream from the receiver has filled the clarifier with fresh liquor, and the fire is lighted, the temper, which is generally Bristol white lime in powder, is stirred into it. This is done in order to neutralise the superabundant acid, and to get rid of which is the great difficulty in sugar making. Alkali, or lime, generally effects this; and at the same time part of it is said to become the basis of the sugar. Mr. Edwards affirms, that it affects both the smell, and taste, of the sugar. It falls to the bottom of the pans in a black insoluble matter, which scorches the bottom of the vessels, and cannot without difficulty be detached from them. But in order that less of the lime may be precipitated to the bottom, little more than half a pint of Bristol lime should be allowed to every hundred gallons of liquor, and Mr. Bousie's method of dissolving it in boiling water previous to mixing it with the cane-juice should be adopted.

As the force of the fire increases, and the liquor grows hot, a scum is thrown up, which is formed of the gummy matter of the cane, with some of the oil, and such impurities as the mucilage is able to entangle. The heat is now suffered to increase gradually, till it nearly rises to the heat of boiling water. The liquor, however, must by no means be suffered to boil. When the scum begins to rise into blisters, which break into white froth, and generally appear in about forty minutes, it is known to be sufficiently heated. Then the damper is applied, and the fire extinguished; and if circumstances will admit, the liquor after this is suffered to remain a full hour undisturbed. In the next place, it is carefully drawn off, either by a siphon, which draws up the clear fluid through the scum, or by means of a cock at the bottom. In either case, the scum sinks down without breaking as the liquor flows; for its tenacity prevents any admixture. The liquor is received into a gutter or channel, which conveys it to the evaporating boiler, commonly called the grand copper; and if produced at first from good and untainted canes, it will then appear almost transparent.

In the grand or evaporating copper, which should be sufficiently large to receive the net contents of one of the clarifiers, the liquor is suffered to boil, and the scum as it rises, is continually taken off by large scummers, till the liquor becomes finer, and somewhat thicker. This operation is continued till the subject is so reduced in quantity that it may be contained in the next or second copper into which it is then ladled. The liquor is

now almost of the colour of Madeira wine. In the second copper the boiling and scumming are continued; and if the subject be not so clean as expected, lime-water is thrown into it. This addition not only serves to give more temper, but likewise to dilute the liquor, which sometimes thickens too fast to permit the feculencies to rise in the scum. When the froth in boiling arises in large bubbles, and is not much discoloured, the liquor is said to have a favourable appearance in the second copper. When, in consequence of such scumming and evaporation, the liquor is again so reduced, that it may be contained in the third copper, it is ladled into it, and so on to the last copper, which is called the *teache*. This arrangement supposes four boilers or coppers, beside the three clarifiers.

In the *teache* the subject undergoes another evaporation, till it is supposed boiled enough to be removed from the fire. This operation is usually called striking, *i. e.* lading the liquor, which is now exceeding thick, into the cooler.

The cooler, of which there are generally six, is a shallow wooden vessel, about eleven inches deep, seven feet in length, and from five to six feet wide. A cooler of this size holds a hogshead of sugar. Here the sugar grains, *i. e.* as it cools it runs into a coarse irregular mass of imperfect crystals, separating itself from the melasses; and the more slowly it cools, the larger grained will be the sugar. From the cooler, it is taken to the curing house, where the melasses drains from it.

But here it may be proper to notice the rule for knowing when the subject is fit to be ladled from the *teache* to the cooler. Many of the negro boilers, from long habit, guess accurately by the eye alone, judging by the appearance of the grain on the back of the ladle; but the practice generally adopted is to judge by what is called the touch, *i. e.* taking up with the thumb a small portion of the hot liquor from the ladle, and, as the heat diminishes, drawing with the forefinger the liquid into a thread. This thread will suddenly break and shrink from the thumb to the suspended finger, in different lengths, according as the liquor is more or less boiled. A thread of a quarter of an inch long generally determines the proper boiling height for strong muscovado sugar.

The curing-house is a large airy building, provided with a capacious melasses cistern, the sides of which are sloped and lined with terras, or boards. A frame of massy joist-work without boarding is placed over this cistern; and empty hogsheds without headings are ranged on the joists of this frame. Eight or ten holes are bored in the bottoms of these hogsheds, and through each of the holes the stalk of a plaintain leaf is thrust six or eight inches below the joists, and long enough to stand upright above

the top of the hogshhead. Into these hogshheads the mass from the cooler is put, which is called potting; and the melasses drains through the spongy stalk, and drops into the cistern, whence it is occasionally taken for distillation. In the space of three weeks, the sugar becomes tolerably dry and fair. It is then said to be cured, and the process is finished.

Sugar thus obtained is called muscovado, and is the raw material whence the British sugar-bakers chiefly make their loaf or refined lump. There is another sort, which was formerly much used in Great Britain for domestic purposes, and was generally known by the name of Lisbon sugar. In the West Indies it is called clayed sugar; and the process of making it is as follows:

A quantity of sugar from the cooler is put into conical pots or pans, which the French call *formes*, with the points downward, having a hole about half an inch in diameter at the bottom, for the melasses to drain through, but which at first is closed with a plug. As soon as the sugar in these pots is cool, and becomes a fixed body, which is known by the middle of the top falling in, the plug is taken out, and the pot placed over a large jar intended to receive the sirup or melasses that drains from it. In this state it is left as long as the melasses continues to drop, when a stratum of clay is spread on the sugar, and moistened with water. This, imperceptibly oozing through the pores of the clay, dilutes the melasses, in consequence of which more of it comes away than from sugar cured in the hogshhead, and the sugar of course becomes so much whiter, and purer. According to Sloane, the process was first discovered in Brazil, by accident: "A hen," says he, "having her feet dirty going over a pot of sugar, it was found under her feet to be whiter than elsewhere." The reason assigned why this process is not universally adopted in the British sugar-islands is, that the water which dilutes, and carries away, the melasses, dissolves and carries with it so much of the sugar, that the difference in quality does not pay for the difference in quantity. However, the French planters have been of a different opinion; in their West India islands, they have always had the apparatus for claying, and always carried on the system. By 57 Geo. 3. c. 43., and 58 Geo. 3. c. 54., bounties are granted on all sugars exported, which have been refined without claying.

Refined or lump-sugar, is that which, being entirely freed from impurities, appears perfectly white, and is sold to the public in conical loaves, whence it has likewise obtained the appellation of loaf-sugar. To produce this article the following is the process: Raw or muscovado sugar is dissolved in water, mixed with lime, clarified by means of bullock's blood, boiled down to a

proper consistency, skimming off the impurities as they rise to the top, and then poured into unglazed conical earthen vessels, where it is allowed to grain. The point of the cone is undermost, and perforated to allow the impurities to separate. The base of the cone is covered with moist clay; the water of which gradually filters through the sugar, and displaces a quantity of impure liquid. The sugar thus purified is called loaf-sugar. When redissolved, and treated in the same way a second time, it is called refined sugar.

Sugar thus procured has a very strong sweet taste. When pure it has no smell. Its colour is white; and when crystallised it is somewhat transparent. It has often a considerable degree of hardness: but it is always so brittle that it can be reduced without difficulty to a very fine powder.

Double refined sugar is clarified by whites of eggs instead of blood, and fresh water instead of lime water.

The perfection of refined sugar, when formed into loaves or lumps, consists in whiteness, joined to a smallness of grain, in being dry, and somewhat transparent.

SUGAR-CANDY, (GER. *Kandiszucker*, *Zuckerand.* DU. *Kandy*, *Kandyzucker*, DA. *Sukkerandi*. SW. *Kandisocker*, *Sockerkandi*. FR. *Sucre candi*. IT. *Zucchero candi*, o *candito*. SP. *Azucar piedra de candi*. PORT. *Assucar candi*. RUS. *Ledenex*. POL. *Cukier lodowaty*. LAT. *Saccharum cantum*, s. *crystallinum*.) is a preparation of sugar, made by melting and crystallising it six or seven times over, to render it hard or transparent. It is of three kinds; white, yellow, and red. The white comes from the loaf, the yellow from the clayed, and the red from the muscovado sugar. The whole process of making sugar-candy is managed in strongly heated chambers, by the aid of vessels containing numerous threads, that intersect each other, and are fastened to the sides in various directions. The sugar thus treated, shoots into crystals around the threads.

SUGAR OF LEAD, or **SACCHARUM SATURNI**. See title **LEAD**.

SULPHUR, or **BRIMSTONE**, is a well known hard, brittle, inflammable substance, of an opake yellow colour. It is found more or less pure in the neighbourhood of volcanoes; where, most probably, it is always expelled from some previous state of combination, by the heat of subterraneous fires. It is a very common ingredient in a great variety of minerals and ores; but it is extracted for sale chiefly from a stone called pyrites.

In order to obtain sulphur from pyrites, this mineral ought to be exposed to a heat sufficient to sublime the sulphur, or to make it distil in vessels, which must be close to prevent its burning.

Sulphur is extracted from pyrites, at a

work at Schwartzemberg, in Saxony, in the high country of the mines, and in Bohemia, at a place called Alten-Sattel.

The furnaces employed for this operation are described by Macquer. They are oblong, like vaulted galleries; and in the vaulted roofs are made several openings. These are called furnaces for extracting sulphur.

In these furnaces are placed earthen-ware tubes, filled with pyrites, broken into pieces of the size of small nuts. Each of these tubes contains about fifty pounds of pyrites. They are placed in the furnace almost horizontally, and have scarcely more than an inch of descent. The ends, which come out of the furnace five, or six, inches, become gradually narrower. Within each tube is fixed a piece of baked earth, in form of a star, at the place where it begins to become narrower, in order to prevent the pyrites from falling out, or choking the mouth of the tube. To each tube is fitted a receiver, covered with a leaden plate, pierced with a small hole, to give air to the sulphur. The other end of the tube is exactly closed. A moderate fire is made with wood; and in eight hours, the sulphur of the pyrites is found to have passed into the receivers.

Some sulphur is found quite pure, and in different forms, principally in the neighbourhood of volcanoes, in caverns, and in mineral waters. Such are the opake kind, called virgin sulphur; the transparent kind, called sulphur of Quito; and the native flowers of sulphur, as those of the waters of Aix-la-Chapelle. It is also found mixed with different earths. Here we may observe, that all those kinds of sulphur which are not mineralised by metallic substances, are found near volcanoes, or hot mineral waters, and consequently in places where nature seems to have formed great subterranean laboratories, in which sulphureous minerals may be analysed and decomposed, and the sulphur separated in the manner in which it is done in the small way in our works and laboratories. However this may be, certainly one of the best and most famous sulphur-mines in the world is that called Solfatara. The Abbé Nollet has published, in the Memoirs of the Academy, some interesting observations upon this subject, from which we shall make the following extract:

“Near Puzzoli, in Italy, is that great and famous mine of sulphur, and alum, called at present Solfatara. It is a small oval plain, the greatest diameter of which is about 400 yards, raised about 300 yards above the level of the sea. It is surrounded by high hills, and great rocks, which fall to pieces, and the fragments of which form very steep banks. Almost all the ground is bare and white, like marl; and is every where sensibly warmer than the atmosphere in the greatest heat of summer; so that the feet of persons walking there are burnt through

their shoes. It is impossible not to observe the sulphur there; for every where, may be perceived by the smell a sulphureous vapour, which rises to a considerable height, and gives reason to believe, that there is a subterraneous fire below, from which that vapour proceeds.

"Near the middle of this field, there is a kind of basin, three or four feet lower than the rest of the plain, in which a sound may be perceived when a person walks on it, as if there were under his feet some great cavity, the roof of which was very thin. After that, the lake Agnano is perceived, the waters of which seem to boil. These waters are indeed hot, but not so hot as boiling water. This kind of ebullition proceeds from vapours rising from the bottom of the lake, which, being set in motion by the action of subterranean fires, have force enough to raise all that mass of water. Near this lake there are pits, not very deep, from which sulphureous vapours are exhaled. Persons who have the itch come to these pits, and receive the vapours, in order to be cured. Finally, there are some deeper excavations, whence a soft stone is procured, which yields sulphur. From these cavities vapours exhale, and issue out with noise, which are nothing else than sulphur subliming through the crevices. This sulphur adheres to the sides of the rocks, where it forms enormous masses: in calm weather the vapours may be evidently seen to rise twenty-five, or thirty, feet from the surface of the earth.

"These vapours, attaching themselves to the sides of rocks, form enormous groups of sulphur, which sometimes fall down by their own weight, and render these places of dangerous access.

"When melted sulphur is gently heated, it flies off in yellow powder, which is called *flower of sulphur*, and is much used in medicine. This article is likewise employed in the making of gunpowder, and fulminating powder; for whitening silk and wool, and some other purposes."

For the foreign names of SULPHUR, see BRIMSTONE.

SULTANIN, an Egyptian gold coin, worth ten shillings British.

SUMACH. (GER. *Schmack*, *Sumach*. DU. *Sumak*, *Smak*. DA. *Smak*, *Sumak*. SW. *Sumack*, *Smack*. FR. *Sumac*, *Roure*, *Roux*. IT. *Sommaco*. SP. *Zumaque*. PORT. *Sumagre*, *Cumagre*. RUS. *Sumak*. POL. *Garbarskie drzewko*, *Mażznika*. LAT. *Rhus*.) Common sumach (*rhus coriaria*) is a shrub that grows naturally in Syria, Palestine, Spain, and Portugal; in the two last it is cultivated with great care: its shoots are cut down every year quite to the root; and, after being dried, they are reduced to powder by a mill, and thus prepared for the purposes of dyeing, and tanning. The sumach cultivated in the neighbourhood of Montpellier, is called *rédoul* or *roudou*.

The infusion of sumach, which is of a greenish fawn-colour, soon becomes brown by exposure to the air: a solution of potash produces but little change on it while recent; acids brighten its colour, and turn it yellow; solution of alum renders it turbid, and produces in it a small quantity of yellow precipitate; the liquor remains yellow.

Acetat of lead produced immediately a considerable quantity of yellowish precipitate, the surface of which was brown; the liquor remained of a clear yellow.

Sulphat of copper produced a copious precipitate, of a yellowish green, which after some hours changed to a brownish green; the liquor remained clear and slightly yellow.

Common sulphat of zinc rendered the liquor turbid, darkened its colour, and produced a deep blue precipitate.

Pure sulphat of zinc did not deepen the colour nearly so much; only a small quantity of a brownish fawn-coloured precipitate was produced.

Sea-salt at first produced no sensible change; but after some hours, the liquor became somewhat turbid, and its colour was rendered a little more clear.

The Spanish sumach is exported in skins, and that of Sicily, (in which island the plant grows abundantly,) in bags. The prime quality of the Sicilian sumach comes from Alcamo; the inferior sorts are bought from Carini, Calatafini, Montreal, Termini, &c. The crop in Sicily is made in July and August.

Sumach may be considered of good quality, when its odour is strong, colour of a lively green, well ground, and free from stalks.

SUN-FLOWER, the *Helianthus* of botanists, has long been in esteem as an ornament to gardens and pleasure grounds; but is now more duly appreciated for its utility to the agriculturalist, and the manufacturer. It is said to be a native of South America, but has been found in most parts of the world; in different degrees of perfection, indeed, according to the strength of the soil, and the temperature of the climate. The seed of this plant should be sown very early in the spring, and in a rich soil, according to the drill-husbandry, and kept clean from weeds. These rules being observed, three or four quarts will serve for an acre of land, and the produce will be abundant. The best mode of harvesting the crop is, by pulling up the whole of the plants, even to their roots, which may be done most advantageously before the heads become very dry, to prevent the birds (all of which are extravagantly fond of the seed or grain) from committing depredations on them. They may be tied up in sheaves, and stacked like other corn, but are better housed. The only peculiar care, exclusively necessary for this kind of crop after it is ga-

thered, is to place the heads so as to be exposed to wind and sun, in order to prevent their being heated in the stack; and also to preserve them from the depredations of the birds, by nets, or other contrivances.

There is no part of this plant which may not be converted to some purpose of great utility and advantage.

First, of the *seeds or grain*. These may be threshed out like any other corn, and are excellent provender for horses, either whole, or bruised, or ground into coarse flour, and mixed with bran. They are also a cheap, substantial, and nourishing food for neat cattle, either whole, bruised, ground, or made into cake, after expressing the oil, of which more hereafter. Nothing can exceed them for feeding sheep, pigs, and poultry; being farinaceous, as well as oleaginous. Lastly, they afford an oil of an exquisite kind, peculiarly applicable to the use of the clothier, in softening and preparing the wool for the card and the loom; to that of the printer, for book-printing; and also to manufactories, and other edifices, for burning in lamps, where purity and brilliancy are required; being scarcely inferior to the spermacei oil for that purpose.

Secondly, of the *fibrous parts* of the plant. These have been hitherto tried but on a very small scale; but have been found, so far as experiment has gone, to produce a material little, if at all, inferior to hemp. It is also reasonably conjectured, that these parts will not be inapplicable to the manufacture of paper.

Thirdly, of the *roots and stems*. These are of great utility wherever faggots are desirable; as for heating ovens, drying malt, placing at the bottoms of corn-stacks, and even for common fuel, &c. &c.

On the whole, we cannot but consider the application of this plant, to the purposes above enumerated, as a recent discovery of almost inestimable value to agriculture, manufactures, and domestic convenience.

SUPERCARGO, a person employed by merchants to go a voyage, and oversee their cargo, or lading, and dispose of it to the best advantage.

SURETY, is where one person becomes bound that another shall do a certain act, or pay a certain debt; and such surety is bound *personally* in default of his principal. But no man shall be answerable for the neglect, default, or miscarriage of another, unless the terms of such responsibility are committed to writing.

These engagements are of two sorts, viz. in civil, and in criminal, proceedings. In civil proceedings, the engagement of the surety is generally by an instrument, called a *bond*, that the principal shall pay a sum of money at a certain time, or perform some other conditions of a civil obligation entered into.

In criminal matters, the obligation of the

surety is generally taken by a magistrate, for the appearance of the principal at some specified time before a court of criminal jurisprudence; and the instrument by which the obligation is adopted, is called a *recognizance*. In both cases, however, the principal is answerable in a pecuniary obligation for the performance of the condition by the principal; and the great difference between the two is, that in the civil process, the extent of the obligation is apparent on the face of the transaction from its commencement; but in the criminal process, the obligation to enforce appearance is, to a great degree, at the discretion of the magistrate.

SURVEYING, the art of, is that part of practical mathematics which teaches the method of ascertaining the limits and superficial contents of lands.

SWALLOW-WORT, (GER. *Schwalbenwurz*. DU. *Zwaluw wortel*. DA. *Svalerod*. SW. *Tulkort*, *Rylort*. FR. *Dompte-venin*. IT. *Vintossico*. SP. *Vencetosigo*. POR. *Hirundinaria*. RUS. *Tschortowa boroda*. POL. *Jaskolcze Ziele*. LAT. *Hirundinaria*.) a hardy exotic plant, which is a native of the south of France, Spain, and Italy. In a fresh state, the root of this vegetable possesses a strong smell, resembling that of valerian.

The silk obtained from the seed-capsules of the Syrian swallow-wort is not only useful for stuffing pillows, spinning fine yarn, both by itself, and mixed with cotton-wool, and cod silk, or the loose filaments of the cocoons, but it affords a valuable material for manufacturing paper of a superior quality: its stalks may be advantageously employed as substitutes for hemp. In Canada, a brown sugar is extracted, by evaporating the juice of its flowers, and the young tops are eaten as asparagus.

SWEEP, in the sea-language, is that part of the mould of a ship, where she begins to compass in at the rung-heads: also, when the hawser is dragged along the bottom of the sea, to recover any thing that is sunk, they call this action sweeping for it.

SWEETS, in the wine trade, denotes any vegetable juice, whether obtained by means of sugar, raisins, or other foreign, or domestic, fruit, which is added to wines, with a design to improve them. Every maker of sweets for sale, must take out a licence, with a duty of 10%; and every retailer of the same, a licence with a duty of 4l. 8s.

SWINE, is a generic term, comprehending the whole porcine race, of both sexes, and of all the different kinds. The hog is believed to have been an indigenous animal of Europe, but was certainly not known in America, till introduced there by Europeans. In both Asia and Africa, hogs have been common so far back as history extends. Among the great variety of kinds with which Great Britain and Ireland abound, it may be matter of some difficulty to decide which was the original one, but there is rea-

son to believe not the *best* for beauty, profit, or general utility. The chief characteristic distinctions among the different breeds of this animal, are in the ear and in the hair. The large pendulous ear, with coarse hair, generally indicates a tendency to magnitude of person, and, at the same time, to thickness of hide, and heaviness of bone; while the erect ear, and fine coat, are usually accompanied by light bone, and thin skin. In a commercial point of view, this animal is of so much importance, that too much attention cannot be given to the different breeds, and to the advantages arising from the mixture of them, or to what agriculturalists term *the crossing* them. This is not a place adapted to the discussion of agricultural subjects, further than they are necessarily connected with those results which are purely commercial; and therefore, all we think it right to add on this part of our enquiry, is the observation, that in time of war, our fleets and armies are, to a great degree, supported by the flesh of this animal; that it is, at all times, in great request as an article of home consumption; and in no small demand as one of foreign exportation. Ireland breeds, and cures, the largest swine, but they are far from being the best flavoured. In England, the counties of York, and Berks, are supposed to produce the best bacon; but whatever may have been the fact formerly, there is no doubt but this commodity of exquisite flavour may be procured in all parts

of the island, where milk, corn, pulse, and potatoes, are to be obtained in plenty; for, though grass, hay, and oil-cake, will fatten an ox to the utmost of which it is susceptible, yet nothing but the articles enumerated will feed a hog, so that its flesh shall be solid, yet tender; its fat firm, yet soluble by mastication; and that it shall be capable of imbibing salt to a degree, that will be proof against putrefaction in all climates. *See title BACON, ante.*

SWIVEL, a sort of small cannon, much used on board merchant-ships, as a weapon of defence.

SWORD, (*Swords*, GER. *Degen*. DU. *Degens*. DA. *Kaarder*. SW. *Värjor*. FR. *Epées*. IT. *Spade*. SP. and PORT. *Espadas*. RUS. *Schpagi*. POL. *Szpady*.) a weapon used either in cutting or thrusting; the usual weapon of fights hand to hand.

SWORD, *Broad*, an original weapon of Scotland, it is sometimes called a back sword, as having but one edge: it is basket-handled, and three feet two inches long.

SWORD, *Regulation*. The sword which is worn by British officers may be properly called a long cut-and-thrust.

Swords of every description are manufactured at Sheffield, and Birmingham; especially at the latter town, where they carry the temper of their blades to an extraordinary pitch of perfection.

SYRUP. *See* SIRUP.

T A C

T, THE nineteenth letter in the alphabet. As a numeral it stands for one hundred and sixty; and with a dash at top, **T̄** signifies one hundred and sixty thousand.

TABBY, a kind of rich silk, which has undergone the operation mentioned in the next article.

TABBYING, the passing a silk or stuff through a calender, the rolls of which are made of iron, or copper, variously engraved; which bearing unequally on the stuff, renders the surface unequal, so as to reflect the rays of light differently, making the representation of waves thereon.

TABLE, among the jewellers. A table-diamond, or other precious stone, is that whose upper surface is quite flat, and only the sides cut in angles: in which sense a diamond cut tablewise, is used in opposition to a rose-diamond.

TACAMAHACA, (GER. *Takamahak*, *Hack und tack*. DU. *Takamahak*. DA. *Hakogtak*. SW. *Tacamahac*. FR. *Tacamacha*, *Gomme tamacha*. IT. *Taccamaca*. SP. and PORT. *Tacamaca*. LAT. *Tacamahaca*.) a solid resinous substance brought from New Spain;

T A C

it is said to be collected likewise in certain other provinces of America, and in the island of Madagascar. There are two sorts of it. The best is called *tacamahaca in shells*: this is concrete, somewhat unctuous and softish, of a pale yellowish or green colour, collected in a kind of shells made from the rind of certain fruits of the gourd kind, and covered over with leaves. Its smell is exceedingly fragrant and delightful, approaching to that of lavender, or ambergris; its taste resinous and aromatic. The kind commonly met with in shops, is in semi-transparent globules, of a whitish, yellowish, brownish, or greenish hue, and of a fragrant odour, less grateful, however, than that of the foregoing. It is principally employed in pharmacy as an ingredient in plasters.

TACK, in a ship, a great rope, having a wale-knot at one end, which is seized or fastened into the clew of the sail; so is reefed first through the chess-trees, and then is brought through a hole in the ship's side. Its use is to carry forward the clew of the sail, and to make it stand close by a wind; and whenever the sails are thus trimmed, the

main-tack, the fore-tack, and mizen-tack, are brought close by the board, and haled as much forward on as they can be.

TACK-ABOUT, in the sea-language, is to turn the ship about, or bring her head about, so as to lie the contrary way.

TACKLE, or **TACKLING**, among seamen, denotes all the ropes or cordage of a ship, used in managing the sails, &c. In a more restrained sense, tackles are small ropes running in three parts, having at one end a pendant and a block; and at the other end a block and a hook, to hang goods upon that are to be heaved into the ship or out of it.

TAEI, or **LEAM**, a small Chinese weight, equal to one ounce and two drachms.

TAFFETY, or **TAFFETA**, (GER. *Taft*. DU. *Taf*. DA. and SW. *Taf*. FR. *Taffetas*. IT. *Taffeta*. SP. *Tafetan*. PORT. *Tafeta*. RUS. *Tafta*. POL. *Kitayka*.) a fine smooth silken stuff, remarkable for its gloss or lustre.

The *taffetas noir lustre*, or black and glossed *taffety*, is what the English call *alamode* or *mode*: and the *non lustre* or *unglossed* of the former, *lustring*.

India furnishes very excellent *taffetas*, but they are by no means comparable to those of France or Italy, in point of durability and the excellence of the workmanship. *Taffetas* are of different qualities, according to the different places in which they are manufactured, and from which places they obtain the various appellations of *Lyonese*, *English*, *Italian*, and *Florentine* *taffetas*, &c. In the manufacture of *taffety* the best kind of Italian silk is usually employed, and it is said, that the peculiar quality of the water used, has considerable influence upon the fabric; thus the admirably beautiful gloss of the *Lyonese* *taffety*, is generally attributed to a property resident in the water of the *Sane*, which the manufacturers of *Lyons* invariably employ.

TALC, a species of mineral, of which there are three varieties:

1. *Earthy Talc*. Its colour is greenish-white, passing into reddish-white, silver-white, pale apple-green, and bright grey. It is found disseminated, superficial, or in kidney-shaped masses. It has a glistening pearly lustre, and is composed of slightly agglutinated scaly particles.

It is found at *Sylva*, in *Piedmont*; near *Freyberg*, in *Saxony*; and at *Meronitz*, in *Bohemia*.

2. *Common Talc*. Its colours are greenish-white, leek-green, and reddish or yellowish white. It occurs in masses, disseminated, and, very rarely, crystallized; in minute hexagonal tables. It has a shining pearly lustre passing into semimetallie.

It abounds in the mountains of *Tyrol*, and *Salsburg*, whence it was brought to market to *Venice*, and thence received the name of *Venetian talc*.

3. *Indurated Talc*. Its colour is greenish-white, of different degrees of intensity, also snow-white, and yellowish-white. It occurs in masses. It has a bright shining lustre, somewhat pearly. It is found in the Alps, in *Stiria*, *Austria*, and *Hungary*; and it is also said, in *Breadalbane*, and the *Shetland islands*, in *Scotland*.

The Chinese make very splendid ornaments of *talc*, tinged of various colours. It is principally used in this country, in the manufacture of crayons, rouge, and for making silver sand for sprinkling on writing. *Talc* is one of the prohibited articles in the Russian tariff, under the name of *Marienglass*.

TALLOW, (GER. *Talg*. DU. *OngeI*. DA. *Talg*, *Talg*. SW. *Talg*. FR. *Suif*. IT. *Sevo*, *Sego*. SP. and PORT. *Sebo*. RUS. *Salo toplenoe*. POL. *Zoy*. LAT. *Sebum*.) a sort of animal fat, melted down and clarified, being used in making soap, and candles, in the dressing of leather, and by salt-boilers for the purpose of imparting a large grain to the salt. Tallow is either *yellow* or *white candle*, or *soap tallow*. Its goodness consists in its sweetness and purity.

It is an object of no small importance to purify or improve tallow. The tallow-chandlers clear it of fibrous matter and other gross impurities by careful melting, straining, and the like mechanical management. It is said also, that they improve its whiteness by the addition of alum, the efficacy of which we are much disposed to doubt. It is thought, too, that long keeping, and the action of the external air, improve its hardness; but these slow operations are ill calculated for a manufactory, in which the greatest part of the capital is vested in the raw material, and very little in the manufacturing process: if they increase the hardness of the tallow, they injure its colour; and candles kept too long do not burn so well.

Our chief importation of tallow is from *Russia*, and *North America*. See AMERICA; and RUSSIA, article EUROPE.

TALLOW-TREE, a tree growing abundantly in *China*, which produces a substance like our tallow, and which serves for the same purposes. This substance is inclosed in a stone or kernel, which is found in the pods produced by the tallow-tree. It is a white pulp, and has the exact consistence, colour, and smell, of Russian tallow. The only preparation it undergoes is being melted down, and mixed with a little oil to make it softer and more pliant.

TAMARINDS, (GER. and DU. *Tamarinden*. DA. *Tamerin*. SW. *Tamarind*. FR. *Tamarins*. IT. and SP. *Tamarindo*. PORT. *Tamarinho*. LAT. *Tamarindus*.) the fruit of the *tamarindus indica*. It is a pod resembling a beancod, including several hard seeds, together with a dark-coloured viscid pulp, of a pleasant acid taste: the

East India tamarinds are longer than the West India sort; the former containing six or seven seeds each, the latter rarely above three or four.

Tamarinds are prepared for exportation at Jamaica, in the following manner: the pods are gathered when fully ripe, the fruit is taken out of them, cleared from the shelly fragments, and placed in layers in a cask; boiling syrup, just before it begins to granulate, is then poured in till the cask is filled. The syrup pervades every part down to the bottom, and when cool, the cask is headed for sale. A better mode of preserving this fruit is with sugar, well clarified with eggs, till a transparent syrup is formed, which produces a pleasant flavour.

TAMLING, the Siamese name for that species of money, and weights, called *tael* by the Chinese. The former is about half as light again as the latter.

TAMBOUR, a species of embroidery. The tambour frame is an instrument of a spherical form, upon which is stretched, by means of a string and buckle, or other appropriate appendage, a piece of silk, muslin, linen, &c. which is wrought with a needle of a particular form, and by means of silver or gold, cotton or silk, into leaves, flowers, or other figures. The manner of working with this machine, was first introduced into this country, by a society of Moravians, who excelled in its use, but it is now become so general, that it is no longer any exclusive source of profit to that society.

TAMMY, a species of woollen stuff, which is manufactured in the best possible manner in England. The wool of our own country is employed in this manufacture, in which the warp, and woof, are nearly equal. The material of the warp for 46 yards of this stuff ought to weigh from 10 lbs. to 10½ lbs. Exeter, and Norwich, are the chief seats of the manufacture of tammies, which we export to almost every part of the world with which we trade.

TAN. This substance exists in a number of vegetables, and in considerable proportion in oak-bark, and nut-galls. It may be obtained from the latter, by infusing them (in the state of coarse powder) in water, and evaporating the solution to dryness. A black matter remains, which is tan, mixed with a small proportion of extractive matter. It may be also precipitated from this solution by the mineral acids.

Tan is a brittle substance, of a brown colour; has a very astringent taste; is soluble in water, and alcohol. It unites with metallic salts, and with many of them forms precipitates; insoluble in water with sulphate of iron it produces a deep blue, which becomes black on exposure to the air; and is the basis of writing ink. The most important property it possesses, is that of forming an insoluble compound with *gelatine*, or animal glue. This is the principle of the im-

portant process of tanning leather. See TANNING.

TANGA, a money of account, used in the East Indies, especially at Goa, and on the Malabar coast. There are two sorts of this money, the *good*, and the *bad*, alloy. The former is one-third heavier than the latter.

TANNING is the art of converting the raw skins of animals into leather. The process which has long been used in this country is as follows: The leather tanned in England, consists chiefly of three sorts, known by the name of butts or backs, hides, and skins. Butts are generally made from the stoutest and heaviest ox-hides, and are managed as follows: after the horns are taken off, the hides are laid smooth in heaps for one or two days in the summer, and for five or six in the winter; they are then hung on poles in a close room, called a smoke-house, in which is kept a mouldering fire of wet tan; this occasions a small degree of putrefaction, by which means the hair is easily got off, by spreading the hide on a sort of wooden horse or beam, and scraping it with a crooked knife.

The hair being taken off, the hide is thrown into a pit or pool of water, to cleanse it from the dirt, &c. which being done, the hide is again spread on the wooden beam; and the grease, loose flesh, extraneous filth, &c. carefully scrubbed out, or taken off; the hides are then put into a pit of strong liquor, called ooze, prepared in pits kept for the purpose, by infusing ground bark in water; this is termed colouring; after which they are removed into another pit, called a scowering, which consists of water strongly impregnated with vitriolic acid, or with a vegetable acid prepared from rye or barley. This operation, (which is called raising,) by distending the pores of the hides, occasions them more readily to imbibe the ooze, the effect of which is to combine with the gelatinous part of the skin, and form with it leather. The hides are then taken out of the scowering, and spread smooth in a pit commonly filled with water, called a binder, with a quantity of ground bark strewed between each. After lying a month or six weeks, they are taken up; and the decayed bark and liquor being drawn out of the pit, it is filled again with strong ooze, when they are put in as before, with bark between each hide. They now ought to lie two or three months, at the expiration of which the same operation is to be repeated; they then remain four or five months, when they again undergo the same process, and after being three months in the last pit, are completely tanned; unless the hides are so remarkably stout as to want an additional pit or layer. The whole process in this manner requires from eleven, to eighteen, months, and sometimes two years, according to the substance of the hide and discretion

of the tanner. When taken out of the pit to be dried, they are hung on poles; and after being compressed by a steel pin, and beaten out smooth by wooden hammers, called battes, the operation is complete; and when thoroughly dry, they are fit for sale. Butts are chiefly used for the soles of stout shoes.

The leather which goes under the denomination of hides, is generally made of cow-hides, or the lighter ox-hides, which are thus managed: After the horns are taken off, and the hides washed, they are put into a pit of water, saturated with lime: where they remain a few days, when they are taken out, and the hair scraped off on a wooden beam, as before described; they are then washed in a pit or pool of water, and the loose flesh, &c. being taken off, they are removed into a pit of weak ooze, where they are taken up and put down (which is technically termed handling) two or three times a day, for the first week; every second, or third, day they are shifted into a pit of fresh ooze, somewhat stronger than the former, till at the end of a month, or six weeks, they are put into a strong ooze, in which they are handled once or twice a week with fresh bark for two, or three, months. They are then removed into another pit, called a layer, in which they are laid smooth, with bark ground very fine, strewed between every two hides. After remaining here two or three months, they are generally taken up, when the ooze is drawn out, and the hides put in again with fresh ooze, and fresh bark, where, after lying two or three months more, they are completely tanned; except a very few stout hides, which may require an extra layer: they are then taken out and hung on poles, and being hammered and smoothed by a steel pin, are, when dry, fit for sale. These hides are called crop hides: they are from ten, to eighteen, months in tanning, and are used for the soles of shoes.

Skins is the general term for the skins of calves, seals, hogs, dogs, &c. These, after being washed in water, are put into lime-pits, as before mentioned, where they are taken up, and put down, every third or fourth day, for a fortnight, or three weeks, in order to destroy the epidermis of the skin.

The hair is then scraped off, and the excrescences being removed, they are put into a pit of water impregnated with pigeon-dung, called a grainer, forming an alkaline ley, which, in a week, or ten days, soaking out the lime, grease, and saponaceous matter, (during which period they are several times scraped over with a crooked knife, to work out the dirt and filth,) softens the skins, and prepares them for the reception of the ooze. They are then put into a pit of weak ooze, in the same manner as the hides, and being frequently handled, are by degrees removed into a stronger, and still stronger, liquor, for a month or six weeks; when they

are put into a very strong ooze, with fresh bark ground very fine, and at the end of two or three months, according to their substances, are sufficiently tanned; when they are taken out, hung on poles, dried, and are fit for sale. These skins are afterwards dressed and blacked by the curriers, and are used for the upper leathers of shoes, boots, &c.

The lighter sort of hides, called dressing hides, as well as horse-hides, are managed nearly in the same manner as skins; and are used for coach-work, harness-work, &c. See titles CURRYING, and LEATHER.

We have here however rather pointed out the process of tanning as it used to be performed, than as it is; for now the interest of money is so valuable, that a quick return supersedes most other considerations in trade, and expedites the process of manufacturing, not unfrequently to the detriment of the article. This is eminently the case in the art of tanning; for by the use of a wild plant called *tormentil*, and other strong astringents, both vegetable and mineral, the time necessary for the process is much shortened, but the article proportionably deteriorated.

TAONBAC, or TOMBAQUA, a mixture of gold, and copper, which the people of Siam set a greater value on than gold itself, considering it more beautiful.

TAPE, (GER. *Band*. DU. *Lind*, *Band*. DA. *Baand*. SW. *Band*. FR. *Ruban de fit*. IT. *Nastro*. SP. *Cinta*. PORT. *Fita*. RUS. *Lenta*. POL. *Wstega*.) a sort of ribbon or narrow band, made either from flaxen, or cotton, thread. Tape is woven upon a small loom in the manner of linen, &c. and the only difference between it and linen, or calico, is, that its warp is narrower. Vast quantities of this article are manufactured in several parts of England, especially in Lancashire; there are likewise considerable manufactures of tape in Normandy, Holland, Flanders, and Germany. At Elbefeld, in the duchy of Juliers, in the latter country, there is a manufacture of tapes which, in point of extensiveness, and the excellence of its productions, stands unrivalled throughout Europe.

TAPESTRY, (GER. *Tapeten*, *Tapetezerey*. DU. *Tapyten*, *Kamerbehangzels*. DA. *Tapetsrie*. SW. *Tapeten*. FR. *Tapiserie*. IT. *Tappezzerie*. SP. *Tapicerias*, *Tapices*. PORT. *Tapecarias*, *Tapizes*. RUS. *Obur*, *Schpaleru*. POL. *Obicie*, *Tzpalery*.) a kind of woven hangings, of wool, and silk, frequently raised and enriched with gold and silver, representing figures of men, beasts, landscapes, histories, &c.

Tapestry-work is distinguished by the artisans into two kinds, viz. that of high, and that of low, warp, though the difference is rather in the manner of working, than in the work itself, which is in effect the same in both, only the looms, and consequently

the warps. are differently situated ; those of the low warp being placed flat, and parallel to the horizon, and those of the high warp, on the contrary, erected perpendicularly.

TAPIOCA, a name given to white sago.

TAR. (GER. *Theer*. DU. *Teer*. DA. *Tiære*. SW. *Tjära*. FR. *Goudron*. IT. *Catrame*. SP. *Alquitran*. PORT. *Alcatrão*. RUS. *Degot*. SMOLA *shikaja*. POL. *Smola gesta*.) If the wood of the turpentine trees be exposed to the fire, in a vessel every where closed, except an aperture at the bottom, as for example in a retort with the neck placed lowermost, the resinous juice melts out by the heat, and at the same time contracts an empyreumatic smell and taste : in this state it is tar. Tar is prepared in different parts of Germany, Norway, Sweden, &c., from the pine, and the fir trees, and in some places from the larch, and the terebinth. The wood is inclosed in a large oven, to the quantity of ten, or more, loads at a time ; this stands within another oven called the mantle, the space betwixt them receiving the fire ; from the bottom of the inner oven runs a gutter, by which the tar is conveyed off, in proportion as it melts out of the wood.

Tar is also obtained from the wood of the trunk, branches, and roots of the pine, heaped together, covered with turf, and set on fire to produce a close combustion, in the same manner as for making charcoal. The oily parts, which are disengaged, trickle down, and are received in a gutter, which serves to convey them to a tub. The most fluid part is sold under the name of *huile de cade* ; and the thicker part is the tar used for paying, or painting the parts of shipping and other vessels. See **PINE-TREE**.

TARE, is an allowance for the outside package, that contains such goods as cannot be unpacked without detriment ; or for the papers, threads, bands, &c. that inclose or bind any goods imported loose, or, though imported in casks, chests, &c. yet cannot be unpacked, and weighed net.

TARIF, or **TARIFF**, a table or catalogue, containing the names of different sorts of merchandise, with the duties to be paid, as settled by authority, amongst trading nations. See **DUTIES**.

TARTAR is obtained in a state of impurity, incrustated on the bottoms and sides of casks in which wine has been kept. It is afterwards purified by dissolving it in boiling water, and filtering it while hot. On cooling, it deposits the pure salt in very irregular crystals. In this state it is sold under the name of crystals or cream of tartar. See **ANGOL**.

TAWING is the art or manner of preparing or dressing skins in white, to fit them or use in divers manufactures, particularly gloves, purses, &c.

All kinds of skins may be tawed, but it is chiefly those of sheep, goats, kids, and lambs, that are used to be dressed this way,

as being those fittest for gloves. See **TANNING**.

TEA, (GER. and DU. *Thee*. DA. *The*. SW. *Thee*. FR. *Thé*. IT. *Té*. SP. *Thé*, *Té*. PORT. *Chá*. RUS. *Tschai*. POL. *Herbata*, *Te*. LAT. *Thea*.) the dried leaves of the tea-plant, a commodity in general use in most parts of Europe, in the civilised parts of America, and in Asia.

The tea-plant is a native of Japan, China, and Tonquin, and has not, as far as we can learn, been found growing spontaneously in any other part of the world.

As China has not yet been explored, we cannot determine what number of species there are in that country ; but as it is now common in the botanical gardens in this, it is evident that there are two species, or at least permanent varieties of it ; one with a much longer leaf than the other, which our gardeners call the green tea, and the other with shorter leaves, which they call the bohea. The green is by much the hardiest plant, and with very little protection will bear the rigour of our winters. It is chiefly propagated in this country by layers.

This plant delights in valleys, and is frequent on the sloping sides of mountains and the banks of rivers, where it enjoys a southern exposure. It flourishes in the northern latitudes of Pekin, as well as round Canton ; but attains the greatest perfection in the mild temperate regions of Nankin. It is said only to be found between the 30th and 45th degrees of north latitude.

In Japan it is planted round the borders of fields, without regard to the soil ; but as it is an important article of commerce with the Chinese, whole fields are covered with it, and it is by them cultivated with care. The tea which grows in rocky ground is superior to that which grows in a light soil ; and the worst kind is that which is produced in a clayey soil. It is propagated by seeds : from six, to twelve, are put into a hole about five inches deep, at certain distances from each other ; of which, it is said, only about a fifth part vegetates.

The leaves are not fit for being plucked till the shrub is of three years' growth. In seven years it rises to a man's height ; but as it then bears but few leaves, it is cut down to the stem, and this produces a new crop of fresh shoots the following summer, every one of which bears nearly as many leaves as a whole shrub. Sometimes the plants are not cut down till they are ten years old.

The first gathering commences at the end of February, or beginning of March. The leaves are then small, tender, and unfolded, and not above three or four days old ; these are called *ficki-tsiaa* or "tea in powder," because it is pulverised ; it is also called sometimes bloom tea. It is sold in China at 20d. or 2s. per pound. The labourers employed in collecting it, do not pull the leaves by handfuls, but pick them up one

by one, and take every precaution that they may not break them. However long and tedious this labour may appear, they gather from four, to ten, or fifteen, pounds a day.

The second crop is gathered about the end of March, or beginning of April. At this season part of their leaves have attained their full growth, and the rest are not above half their size. This difference does not, however, prevent them from being all gathered indiscriminately. They are afterwards picked, and sorted into different parcels, according to their age, and size. The youngest, which are carefully separated from the rest, are often sold for leaves of the first crops. Tea gathered at this season is called *too-tsiaa*, or, "Chinese Tea," because the people of Japan infuse it, and drink it after the Chinese manner.

The third crop is gathered at the end of May, or in the month of June. The leaves are then very numerous, and thick, and have acquired their full growth. This kind of tea, which is called *ben-tsiaa*, is the coarsest of all, and is reserved for the common people. Some of the Japanese collect their tea only at two seasons of the year, which correspond to the second, and third, already mentioned; others confine themselves to one general gathering of their crop, towards the month of June; however, they always form afterwards different assortments of their leaves.

The finest, and most celebrated, tea of Japan, is that which grows near Ud-si, a small village situated close to the sea, and not far distant from Meaco. In the district of this village is a mountain, extremely well adapted for the culture of fine tea. It is inclosed by hedges and ditches, to prevent all access to it. The tea-shrubs that grow on this mountain, are planted in regular order, and are divided by different avenues and alleys. The care of this place is intrusted to people, who are ordered to guard the leaves from dust, and to defend them from the inclemency of the weather. Before collecting the tea, it is said, they abstain from every kind of gross food for some weeks, that their breath, and perspiration, may not in the least injure the leaves, which they do not touch but with very fine gloves. Other extraordinary things have been related respecting the process by which this select sort of tea is prepared, and preserved; but they rest on very equivocal authority, and therefore are omitted here.

When the tea-leaves have been collected, they are exposed to the steams of boiling water; after which they are put upon plates of copper, and held over the fire until they become dry and shrivelled, and appear such as we have them in Europe.

The mode of preparing tea, in the island of Japan, has been thus described:

The tea is prepared in public buildings destined for the purpose, where the proper instruments are furnished. The preparation

consists in putting some pounds of fresh-gathered leaves into a large shallow pan, made of thin iron, and heated by an appropriate stove. They are shaken, and turned with the hands very quickly, in order that they may dry as equally as possible. This operation is continued till a little crackling is heard on the iron plate. The heat, in depriving the leaves of their juices, dissipates the narcotic and injurious qualities which they naturally possess. It is necessary to roast the leaves whilst quite fresh, because if kept some days, they turn black, and lose their value. The heat used should be such as the hand can scarcely bear.

In commerce, eight principal sorts of tea are distinguished, three of green and five of bohea; but it should be observed, the bohea tea of the traders is not the same which bears that name in China. The three sorts of green tea are, 1. The Imperial or Bloom Tea; the leaves of this are not rolled: they are of a bright-green colour, and have a very agreeable perfume. 2. The Haisven, or Hyson, so called from the name of an Indian merchant, who first brought it into Europe; the leaves of this are small and tightly rolled, and are of a bluish-green colour. 3. The Singlo, or Souglo, a name, like that of several other kinds, derived from the place where it is cultivated.

The five sorts of Bohea tea of commerce, best known, are, 1. The Souchong, which consists of large leaves not rolled, and of a colour inclining to yellow. This sort is divided into parcels of half a pound each, and is conveyed into Russia by the caravans. 2. The Sumlo, Camho, or Campoi, which has a violet smell, and gives a pale infusion. 3. The Congou, which has also large leaves, and gives a high-coloured infusion. 4. The Peko, which is known by little white flowers that are mixed with it. 5. The Bohea; the leaves of this are of a greenish-brown colour, and uniform throughout.

There is besides these a sort of tea brought from China, in round balls of different sizes, called China Balls, in which the leaves are glued together by some substance that does not alter the quality. There are also to be met with, balls of medicinal tea, composed of leaves which have imbibed a decoction of rhubarb. There are also several other varieties which it is not necessary to enumerate.

The first European writer who mentions tea is Giovanni Botero, an eminent Italian author, about the year 1590. "The Chinese (says he) have a herb out of which they press a delicate juice, which serves them for drink instead of wine; it also preserves their health, and frees them from all those evils which the immoderate use of wine produces among us."

Tea was introduced into Europe in the year 1610 by the Dutch East-India Company. It is generally said, that it was first

imported from Holland into England, in 1666, by the lords Arlington and Ossory, who brought it into fashion among people of quality. But it was used in coffee-houses before this period, as appears from an act of parliament made in 1660, in which a duty of 8*d.* was laid on every gallon of the infusion sold in those places. In 1666 it was sold in London for 60*s.* per pound, though it did not cost more than 2*s.* 6*d.* or 3*s.* 6*d.* at Batavia. It continued at this price till 1707. In 1715 green tea began to be used; and as great quantities were then imported, the price was lessened, and the practice of drinking tea descended to the lower ranks. In 1720 the French began to send it to us by a clandestine commerce. Since that period the demand has been increasing yearly, and it has become almost a necessary of life in most parts of Europe.

In 1766 the whole quantity of tea imported into Europe amounted to 17,000,000 lb.; in 1785 it was computed at 19,000,000 lb. Since that period it has increased to a degree that is astonishing, from the great increase of demand, particularly among the northern nations, where, till lately, it was only known as a luxury. The statutes, by which the importation of it into this country and the trade of vending it, are regulated, are much too numerous to be referred to. The exclusive importation of it, however, from China, is confined to the East India Company, by 53 Geo. 3. c. 135. See article *India Company*, title *COMPANY*.

Every person dealing in tea must not only take out a licence for that purpose, but must cause the words "*dealer in tea*," to be placed over his door, under a penalty of 200*l.*; and any person purchasing of a dealer not having such inscription, &c. incurs a penalty of 10*l.* 19 Geo. 3. c. 69. The adulteration of tea is subject to a penalty of 100*l.* and forfeiture of the same, by 17 Geo. 3. c. 29. By 54 Geo. 3. c. 142. tea may be exported to British colonies without payment of any duty. It would be quite beside our purpose to cite the various authors who have written on the subject of tea, either in a botanical, a medical, or a commercial point of view. Their assumptions are frequently contradictory, and their inferences inconsistent: however, we may safely refer the reader for more scientific information, both botanical and medical, to "*Lettsom on the Tea Tree*," 1772.

TEAK, or **TECK-WOOD**, is the produce of a tree growing in the kingdoms of Ava and Pegu, as well as on the coast of Malabar, where it is employed in the construction of the vessels fitted out at Bombay. The vessels built at Madras, and Calcutta, are likewise formed of teak-wood brought from Ava and Pegu. The English purchase immense quantities of teak-wood annually, at Rangoon, the principal port of the latter kingdom, for which they barter Indian com-

modities of almost every description. The importance of the traffic to which this wood gives rise, may readily be conceived, when it is asserted, that the total burden of the vessels belonging to Calcutta, which are formed of it, amounts to 40,000 tons. This is the only species of wood which can be advantageously employed in the construction of the large Bengalese vessels; for it has been ascertained, that the indigenous wood of Bengal is scarcely serviceable at all in the Indian seas. By 54 Geo. 3. c. 66. teak-wood from the East Indies is allowed to be imported duty-free.

TEASEL or **TEAZELL**, (GER. *Weberdistel*. *Kratzdistel*, *Karden*. DU. *Kaarden-distel* *Kaardebollen*. DA. *Kardetidsel*, *Tids-elkarder*. SW. *Kardtistel*. FR. *Chardon à carder*. IT. *Cardo da cardare*. SP. *Cardencha*, *Cardo peinador*. PORT. *Cardo penteador*. RUS. *Sukonnaja tschotka*. POL. *Szczotka*. LAT. *Carduus fullonum*.) the manured or fullers' teasel.

This plant, which is cultivated in the north, and west, of England, is an article of considerable importance to clothiers, who employ the crooked awns of the heads for raising the knap on woollen cloths; for this purpose they are fixed round the periphery of a large broad wheel, against which the cloth is held while the machine is turned.

In choosing teasels, the preference should be given to those with the largest bur, and most pointed, which are generally called *male teasels*. They are mostly used in preparing and dressing stockings, and coverlets; the smaller kind, commonly called the *fullers'* or *drapers'* and sometimes the *female teasels*, are used in the preparation of the finer stuffs, as cloths, rateens, &c.

TECCALIS. See **ABUCCO**.

TELA, gold medals struck by every king of Persia at his coming to the crown. These telas are distributed among the people. Their weight is much the same as that of the German ducat. See **CHERAFIS**.

TELEGRAPH. Resembling the system of signals or beacons in all its essentials, but having the advantage of conveying words with rapidity to any visible distance, and from station to station, by thirty distinct signs, the telegraph was an invention of the French in 1794. By them it was applied to announce the approach of British cruisers along the coasts, and also inland to, and from, the armies on the frontiers; and by the British government, likewise, it was applied to similar purposes the next year, the first communication taking place in January 1796. An attempt had been made in 1687 to communicate in this way, and in fact the contrivance of signals twenty-two years before, though more complex, by means of flags, balls, guns, and colours, was in purpose, and to a certain degree in effect, the same thing, but differing as to adaptation for land or sea service. The antiquity

of signals or beacons, by fire, is well known along most of the coasts of England, not only from historical mention having been made of the general fact, and also of many of the hills or stations where they were erected, but is proved by the ancient mason-work still remaining, as also by not a few of the lanterns erected on the summits of churches near the sea. The system of fire-beacons, seaward, as well as from beacon to beacon, was in a tolerable state of intelligent communication, when it was put down by act of parliament, in aid of the revenue laws before the year 1800. In 1818 the original telegraph was superseded by an improvement upon its principle, by means of a simple instrument called a Semaphore, a single pillar supplied with numerous arms.

TELLURIUM, a metal discovered by Klapproth, in the year 1798, in an ore of gold found near Zalethna, in Transylvania. It is found in a metallic state. It is very brilliant, of nearly a white colour, easily fusible, and rises in vapour at an intense red heat; soluble in the nitric and nitromuriatic acids. When it is heated in the atmosphere, it burns with a pale blue flame edged with green. It has not been employed in the arts.

TEMAN, a liquid measure used at Mocha, in Arabia Felix, containing ten memedas.

TEMPERING, the preparing of steel and iron, so as to render them more compact, hard, and firm, or even more soft and pliant, according to their respective occasions. The metals are tempered by plunging them, while red-hot, into some fluid prepared for the purpose; sometimes pure water alone is used, and in fact locksmiths, &c. scarcely use any thing else.

Sometimes a composition of various juices, liquors, &c. is used, as vinegar, mouse-ear water, nettle, or Spanish radish water, and water oozing from broken glasses, soot, salt, oil, spirit of wine, sal ammoniac, &c.

TENDER, is an offer to pay a debt, or to perform a duty; in every plea of tender, where money is the specific thing demanded by the action, and the debt or duty is not discharged by the tender and refusal, money may be brought in without leave of the court; in all other cases, the leave of the court must be obtained before money can be brought into court.

A tender should be made by the principal; but if it is made by a servant, or by a stranger, on the behalf, and by the desire, of the party, it will be as valid, as if made by the party himself.

No tender is good, unless the party making it declares upon what account such tender is made; and it will not be sufficient for the party proposing to make the tender, to say he is ready to pay a debt, or to perform a duty; but he must make an actual offer to pay the one, and perform the other

An actual tender of money in a bag is a good tender; provided it can be proved that the sum proposed to be tendered, was actually in such bag at the time of the tender.

A tender of more than is due will be good for what is actually due.

If money tendered be once accepted, although some of it should be counterfeit or deficient in value, or although there should not be so much, as it was tendered for, the acceptor has no remedy, because it was his duty to have examined, and told, it before he accepted it.

A tender of a bank-note, as money, is not a legal tender, if it be specifically objected to as such; but the party to whom such bank-note is tendered, cannot hold the party to bail.

Every tender must be made before any action is commenced; and where a tender has, in fact, been made before a writ has been sued out, the court out of which such writ shall issue, will take care that the tender shall not be made void by anterior relation of the writ.

If money is to be paid, or goods are to be delivered, at a certain place, upon, or before, a day certain, a tender cannot be made before the last day appointed for the payment of such money, or the delivery of such goods.

TENON, in building, &c. the square end of a piece of wood, or metal, diminished by one-third of its thickness, to be received into a hole in another place, called a mortise, for jointing or fastening the two together. It is made in various forms, square, dove-tailed, for double mortises, &c.

TENT, a strong, sweet-flavoured red wine, made in the province of Andalusia, in Spain, where it is known under the name of Tinta Rota. It is an excellent stomachic. In Catalonia, another province of Spain, are made two species of wine called *tinto de las montañas*, or mountain tent, and *matará*; both of which are oftentimes sold by some dishonourable traders as *rota tent*.

TENTER, a railing used in the cloth manufacture, to stretch out the pieces of cloth, stuff, &c. or only to make them even, and set them square. It is usually about four feet and a half high, and for length exceeds that of the longest piece of cloth. It consists of several long pieces of wood, placed so that the lower cross piece of wood may be raised or lowered, as is found requisite, to be fixed at any height by means of pins. Along the cross pieces, both the upper, and under one, are hooked nails, called *tenter-hooks* driven in from space to space. It is made felony *sans* clergy, to steal cloth on the tenters in the night time, by 22 Car. 2. c. 5.; and having in possession any cloth stolen from the tenters, and not giving a good account of the manner of becoming possessed, is subjected to transportation by 15 Geo. 2. c. 27.

TEWEL, or **TOWER**, the taper pipe fixed in the back of a forge, into which is placed the bellows.

TUOI, in the Chinese manufactory of porcelain, a word used to express a particular sort of varnish of that ware, with a violet colour and gold.

THRAVE, or **THREAVE**, of corn, twenty-four sheaves, or four shocks of six sheaves to the shock, though, in some counties, they only reckon twelve shocks to the thrave.

THREAD, (GER. *Zwirn*. DU. *Garen*. DA. *Traad*. SW. *Tråd*, *Twinntråd*. FR. *Fil*. IT. *Refe*. SP. *Hilo*, *Torzal*. PORT. *Fio*, *Fiado*. RUS. *Niki*. POL. *Nici*.) a small line made up of a number of fine fibres of any vegetable, or animal, substance, such as flax, cotton, or silk; from which it takes its name of linen, cotton, or silk, thread.

Linen, and cotton, thread may be dyed of a durable and deep black by a solution of iron in sour beer, in which the linen is to be steeped for some time, and afterwards boiled in madder. See the article **DYEING**.

Thread may be easily bleached by the oxymuriatic acid. This acid whitens cloth remarkably well, but it is still more advantageous for bleaching thread. Vast quantities of cotton thread are made in several parts of Great Britain, but the most extensive manufactory for this article is established at Paisley near Glasgow, which however is so inadequate to supply the market, that abundance of cotton thread is annually imported from Germany, the Netherlands, &c.

THROWSTER, the mechanic whose business it is to prepare raw silk for the weaver, by cleansing, and twisting it.

TIBOSE, an East India coin, being one of the rupees current in the late territories of the Grand Mogul, and worth double the Gasna rupee.

TICAL. See **BAAT**.

TICK, or **TICKING**, (GER. *Bühhrenzeug*. DU. *Bettetyk*. DA. *Burenwerk*, *Dynevaar*. SW. *Bolstervar*. FR. *Tages*. IT. *Federa*. SP. *Terliz para colchones*, *Cuasdro*. PORT. *Tréz*, *Trespanno*. RUS. *Tik*. POL. *Naspa*, *Nasyпка*.) a sort of texture used for covering bedding. Ticking is made either from hemp, or flax, being woven in the loom in the same manner as linen, from which, however, it differs both in quality, and appearance, being coarse and stiff, though close, and presenting a surface marked with narrow, blue, and white, stripes alternately. Of this article considerable quantities are manufactured in different parts of Great Britain, and Ireland, and in great abundance in Germany, whence we import it occasionally.

TIDE-WAITERS, or **TIDESMEN**, are inferior officers belonging to the custom-house, whose employment is to watch or attend upon ships, until the customs are paid; they get this name from going on

board ships on their arrival in the mouth of the Thames, or other port, and so coming up with the tide.

TIERCE, or **TEIRCE**, a measure of liquid articles, as wine, oil, &c. containing the third part of a pipe, or forty-two gallons.

TIFFANY, a sort of transparent gauze, stiffened with gum, and pressed. It is much employed in the making of artificial flowers, &c. The best tiffany is made in this country; which is so excellent, that even the French eagerly purchase it, though its importation is prohibited in France.

TILES, (GER. *Dachziegel*. DU. *Dakpannen*. DA. *Tagstene*. SW. *Dakpannor*. FR. *Tuiles*. IT. *Tegole*, *Embrici*. SP. *Tejas*. PORT. *Telhas*. RUS. *Tscherepiza*. POL. *Dachowki*.) a sort of thin brick, dried in a kiln, and used in covering and paving different kinds of buildings. The best brick earth only should be made into tiles.

The tiles for all sorts of uses may now be comprised under eight heads, viz.: 1. The plain tile for covering of houses, which is flat and thin. 2. The plain tile for paving which is also flat, but thicker; and its size nine, ten, or twelve inches. 3. The pan-tile, which is also used for covering of buildings, and is hollow, and crooked, or bent somewhat in the manner of an S. 4. The Dutch glazed pan-tile. 5. The English glazed pan-tile. 6. The gutter-tile, which is made with a kind of wings. 7. The hip, or corner tile. 8. The draining tile.

TILES, *plain*, are not laid in mortar, but pointed only on the inside, having been laid in rows, each row projecting over that below it, like slates, on the roofs of buildings.

TILES, *paving*, are made of a more sandy earth than the plain tiles; the materials for these last must be clay, of the stiffest texture. These are made thicker and larger than the common roof-tiles; and when care has been taken in the choice of the earth, and the management of the fire, they are very regular and beautiful.

TILES, *pan*, when of the best kind, are made of clay, like that of the paving-tiles; but the best sort of all is a pale-coloured loam that is less sandy; they have about the same degree of fire given them in the baking, and they come out nearly of the same colour. These tiles are laid in mortar, when they will not cover the building, so that no water can pass between them.

TILES, *pan*, *Dutch glazed*, get the addition of glazing in the fire. Many kinds of earthy matter running into a glassy substance in great heat, is a great advantage to them; preserving them much longer than the common pan-tiles.

TILES, *pan*, *English glazed*, are in general not so good as the Dutch ones under that denomination; but the process is nearly the same.

TILES, *Dutch*, for chimneys, are of a kind very different from all the rest. They

are made of a whitish earth, glazed, and painted with various figures, in blue or purple colour, and sometimes quite white; they are about 6.5 inches each way, and three quarters of an inch thick. They are little used at present, except for ornamental dairies.

TILES, gutter, are made of the same earth as the common pan-tiles, and only differ from them in shape; but particular care is taken in tempering and working the earth for these, for none are more liable to accidents. The edges of these tiles are turned up at the larger ends for about four inches. They are seldom used where lead is to be had.

TILES, hip or corner, are at first made flat, like pan-tiles of a quadrangular figure, whose two sides are right lines, and the ends arches of circles; the upper end concave, and the lower convex, the latter being about seven times as broad as the other; they are about 10.5 inches long; but before they are burnt are bent upon a mould in the form of a ridge tile, having a hole at the narrow end, to nail them on the hip-corner of the roof.

TILES, ridge, are used to cover the ridges of houses, and are made in the form of a semicylindrical surface, about 15 inches in length, and of the same thickness as plain tiles; their breadth at the outside measures about sixteen inches.

TILES, draining, are of modern invention, and compose aqueducts under ground, being made to fit into one another for that purpose. In favour of agriculture, these last mentioned, with such as are necessary appendages, are exempt from duty, by 55 Geo. 3. c. 176.; all the other kinds made in this country being subject to a duty of excise, as well as to statutory regulations respecting size, &c. cognizable by information, and summary conviction before justices of the peace.

TILLER of a Ship, a strong piece of wood fastened in the head of the rudder, and in small ships and boats called the helm.

In ships of war, and other large vessels, the tiller is fastened to the rudder in the gun-room; and to the other end there are ropes fastened, which pass upwards to the quarter-deck, where the ship is steered by means of a wheel.

TIMBER, (GER. *Bauholz*, *Zimmer*. DU. *Timmerhout*. DA. *Timmer*. SW. *Timmer*. FR. *Bois de charpente*, *Bois à bâtir*. IT. *Legname da fabbricare*. SP. *Madera de construccion*, *de fabrica*, *de decarpinteria*. PORT. *Madeira de construcção*. RUS. *Ströwewi Gess*. POL. *Cembrowina*.) includes all kinds of felled and seasoned wood.

Of all the different kinds known in Europe, oak is the best for building; and even when it lies exposed to air and water, there is none equal to it. Fir-timber is, however, perhaps more generally useful than any

other. It is used for flooring, wainscoating, and the ornamental parts of building within doors. Elm is the next in use, especially in England and France; it is very tough and pliable, and therefore easily worked, it does not readily split; and it bears the driving of bolts and nails better than any other wood.

Ash is chiefly used by wheelwrights and coachmakers, for shafts, naves, &c. Beech is also used for many purposes; it is very tough, and white, when young, and of great strength, but liable to warp very much when exposed to the weather, and to be worm-eaten when used within doors; its greatest use is for bedsteads, chairs, and other household goods. Wild-chestnut timber seems to have been much used in old buildings; but these trees are scarce at present; and this timber is now but little used. Walnut-tree is excellent for the joiner's use, it being of a more curious brown colour than beech, and not so subject to the worms. The poplar, abel, and aspen-trees, which are very little different from each other, are employed mostly by turners, &c. Sycamore is coming much into use for many of the domestic purposes, where its extreme lightness is its principal recommendation, such as ladies' work-boxes, picture-frames, &c.

Larch has recently been found to rival the oak, for all sorts of work under water, and is every day becoming of higher estimation, especially as its bark is little inferior to that of the oak for tanning. The goodness of timber not only depends on the soil, and situation, in which it stands, but likewise on the season wherein it is felled. As the sap and moisture of timber are certainly the causes of its perishing soon, it seems evident that timber should be felled when there is the least sap in it, viz. after the time that the leaves begin to fall.

After timber has been felled and sawed, it must be seasoned; for which purpose some advise it to be laid up in a very dry airy place, yet out of the wind, and sun, or at least free from the extremities of either; and that it may not decay, but dry evenly, they recommend it to be daubed over with cow-dung. It must not stand upright but lie all along, one piece over another, only kept apart by short blocks interposed, to prevent a certain mouldiness which they are otherwise apt to contract in sweating on one another: from which arises frequently a kind of fungus, especially if there is much sap. Others advise timber to be laid in some running stream, in order to extract the sap, and afterwards to dry it in the sun or air. Some again are for putting it in the earth, others in a heat; and some for seasoning with fire. The Venetians first found out the method of seasoning by fire, which is, done after this manner: they put the piece to be seasoned into a strong and violent flame, in which they continually turn it round by means of an en-

gine, and take it out when it is every where covered with a black coaly crust; when the internal part of the wood is so hardened that neither earth, nor water, can damage it for a long time afterwards.

Timber, under different views, is the subject of many statutable provisions in this kingdom. Its preservation is, to a certain degree, placed under the protection of the magistrates, and in that view 6 Geo. 3. c. 48. and 15 Geo. 3. c. 33. have declared what has come under the denomination of *timber*, by enumerating them in the following order: oak, beech, chesnut, walnut, ash, elm, cedar, fir, ash, lime, sycamore, birch; poplar, alder, larch, maple, and horn-beam. Cutting down, lopping, or otherwise damaging, or destroying these, subjects the offender to penalties, progressive in weight, according to the repetition of the offence. See 2 Dick. Pract. Expos. 1086.

Oak is prohibited from being felled, but at particular seasons, in order that the bark may be preserved for the manufacture of leather.

Besides there are several local provisions for the preservation and encouragement of the growth of timber, in the king's forests, which do not come within the scope of our design.

The following are the contents of the loads of different species of timber hewn and unhewn.

A load of timber, unhewn 40 feet.

A load of squared timber, 50 feet.

A load of one-inch plank, 600 square feet.

A load of 1½-inch plank, 400 square feet.

A load of 2-inch plank, 300 square feet.

A load of 2½-inch plank, 240 square feet.

A load of 3-inch plank, 200 square feet.

A load of 3½-inch plank, 170 square feet.

A load of 4-inch plank, 150 square feet.

TIN, (GER. *Blech*, *Weissblech*. DU. *Blik*, *Blek*. DA. *Blik*. SW. *Bleck*. FR. *Fer blanc*. IT. *Latta*, *Banda stagnata*. SP. *Hoja de lata*. PORT. *Folha de Flandes*. RUS. *Blächa*, *Shest*. POL. *Blacha*, *Blacha pobielsana*.) a metal, of which, what is not imported, is obtained principally from the county of Cornwall.

Tin is found in a native or pure state; though more frequently mixed with a large portion of arsenic, sulphur, and iron; the crude ore is first broken to pieces and washed, then roasted in an intense heat, which dissipates the arsenic, and afterwards fused in a furnace, till it be reduced to a metallic state.

Tin is the lightest, and most fusible, of all metals: it is of a greyish white colour, has a strong disagreeable taste, and when rubbed, emits a peculiar odour: it is also remarkably malleable, and when beaten into very thin plates, or tin-foil, is employed in covering looking-glasses: tin readily unites with copper, forming the compositions known by the names of bronze, and bell-metal: by im-

mersing thin plates of iron into melted tin, they become coated, and are then termed block tin, or latten, which is manufactured into saucepans, canisters, culinary utensils, &c.

There are considerable tin-mines on the Malabar Coast, in the island of Banda, in Spain, and in the Spanish West Indies; both the latter are not worked. But mines which produce by far more tin than any of those, are the tin-mines of Cornwall, mentioned above. The tin of this whole county, which in Carew's time, (in the last century,) amounted only to 50, or 40,000*l.* yearly, has of late amounted to 180,000*l.* and 190,000*l.* sterling. Of this the Duke of Cornwall receives for his duty 4*s.* on every cwt. of coined white tin, about 10,000*l.* per annum; the bounders or proprietors of the soil about one-sixth at a medium clear, or about 50,000*l.* annually; the remainder goes to the adventurers in the mines, who are at all the charges of working.

The tin being divided among the lords, and adventurers, is stamped, and worked at the mill; and being thus dressed, is carried under the name of *black tin* to the melting-house, where it is melted by Welsh pit-coal, poured into blocks and bars, and carried to the coinage-town.

The coinage-towns are five towns appointed in the most convenient parts of the county of Cornwall, for the tanners to bring their tin to, every quarter of a year. These are Liskeard, Lestwithiel, Truro, Helston, and Penzance.

The total quantity of tin imported into Great Britain in the year ending 5th January, 1819, is 1456 cwt. 3 qrs.; of which 1398 cwt. 2 qrs. 14 lb. were imported from the East Indies.

The total amount of all tin exported from Great Britain in the said year, was 34,043 cwt. 17 lb. British tin, and 1581 cwt. 1 qr. 9 lb. foreign tin.

Tin is consumed in large quantities by dyers, in the form of nitrate of tin. This salt added to the solutions of cochineal, archil, &c. gives a great brilliancy to their colour. Cochineal, alone, produces a dull crimson colour, but by the addition of nitrate of tin, it becomes a fine scarlet.

TINCAL, the rough or unrefined borax. See BORAX.

TINCTURE, an extract from some drug made in spirits, and usually produced by distillation. Thus we have tincture of myrrh, &c.

TIN-FOIL, (GER. *Stanniol*. DU. *Stanniol*. DA. *Tinblad*, *Stanniol*. SW. *Bladten*, *Stanniol*. FR. *Tain*, *Teint*. IT. *Stagnuolo*. SP. *Estano en hojas para azogar*, *Hoja de estanho*. PORT. *Folha de estanho*.) See FOIL.

TIN-GLASS. See BISMUTH.

TINSEL. (GER. *Lahn*. DU. *Laan*. DA. *Lahn*. SW. *Lan*. FR. *Lame d'or ou*

d'argent. It. Lustrino. Sp. Hojuela.) See FOIL, and ORSIDEW.

TINNING, is the art of covering any metal with a thin coating of tin. Copper, and iron, are the metals most commonly tinned. The use of tinning these metals is, to prevent them from being corroded by rust; as tin is not so easily acted upon by the air, or water, as iron, and copper are.

What are commonly called tin-plates, or sheets, so much used for utensils of various kinds, are in fact iron plates coated with tin.

The principal circumstance in the art of tinning, is, to have the surfaces of the metal to be tinned perfectly clean and free from rust, and also that the melted tin may be perfectly metallic, and not covered with any ashes or calx of tin.

Tinning of iron. When iron plates are to be tinned, they are first scoured, and then put into what is called a pickle, which is sulphuric acid diluted with water; this dissolves the rust or oxyde that was left after scouring, and renders the surface perfectly clean. They are then again washed, and scoured. They are now dipped into a vessel full of melted tin, the surface of which is covered with fat, or oil, to defend it from the action of the air. By these means, the iron coming into contact with the melted tin in a perfectly metallic state, it comes out completely coated.

When a small quantity of iron only is to be tinned, it is heated, and the tin rubbed on with a piece of cloth, or some tow, having first sprinkled the iron with some powdered resin, the use of which is to reduce the tin that may be oxydated. Any inflammable substance, as oil, for instance, will have in some degree the same effect, which is owing to their attraction for oxygen.

Tinning of copper. Sheets of copper may be tinned in the same manner as iron. Copper boilers, saucepans, and other kitchen utensils, are tinned after they are made. They are scoured, then made hot, and the tin rubbed on, as before remarked, with resin. Nothing ought to be used for this purpose but pure grain tin; but lead is frequently mixed with the tin, both to adulterate its quality, and make it lie on more easily.

To whiten brass or copper by boiling. Put the brass or copper into a pipkin with some white tartar, alum, and grain tin, and boil them together. The articles will soon become covered with a coating of tin, which, when well polished, will look like silver. It is in this manner that pins, and many sorts of buttons, are whitened.

TIRE-SMITH, one who practises an ingenious branch of the smith's business, making the iron-work for all sorts of coaches.

TISSUE, is a term used to signify cloth interwoven with gold, or silver, or figured colours.

TITANIUM, a metal found in black sand, resembling gunpowder, in Cornwall,

and upon examination it is found to possess the following properties:

Its colour is orange-red, and it has a good deal of lustre. As it has been only obtained in very small agglutinated grains, neither its hardness, specific gravity, nor malleability, has been ascertained. It is one of the most infusible of metals, requiring a greater heat to melt it than can be produced by any method at present known.

Oxyde of titanium was used to give a brown or yellow colour in painting on porcelain, before its nature was known; but it was found difficult to obtain from it an uniform tint, probably from its not being in a state of purity.

TOBACCO, (*Ger. Taback, Rauchtack. Du. Tabak. DA. and Sw. Tobak, Fr. Tabac. It. Tabacco. Sp. and Port. Tabaco. Rus. Tabak. Pol. Tobaka. Lat. Tabacum, Petum;*) a plant, whose leaves are in such general request in most parts of the world, that it forms a most extensive, and important branch of commerce.

Tobacco requires a moderately strong, yet rich, compact, and deep, soil, and one that is not too much exposed to moisture; indeed, a fresh, unimpaired spot of land is best adapted to the culture of a plant which is greedy of succulence. The tobacco seed is sown in beds, and so soon as the plants appear about two inches above ground, and put forth at least six leaves, they are gently drawn, during damp weather, and carefully transplanted into a patch of land previously prepared for the purpose, being placed at the distance of three feet asunder. If this operation be carefully performed, the leaves will not undergo any alteration for the worse, but will recover their vigour in less than twenty-four hours. This plant demands continual attention.

The weeds which spring up around it must be carefully removed as they appear, its tops cut when it has grown to the height of two feet and a half. In order to prevent its attaining too great a height, suckers are to be carefully lopped off, and all the lower leaves, as well as those which appear likely to suffer by rotteness, or the attacks of insects, carefully removed, so as to let not more than eight, or ten, leaves at most remain upon the stem. One industrious labourer is capable of thus cultivating 2500 stalks, which ought to render a thousand pounds weight of tobacco. The tobacco is let to remain about four months in the ground. In proportion as it approaches to maturity, the bright vivid green of the leaves assumes a darkish hue, the leaves themselves appear to droop and emit an odour, the strength of which is daily augmented. When these symptoms are evident, and particularly when the odour is perceived at some distance from the plant, the tobacco is ripe, and may be cut down. The plants, when cut down, are placed in heaps on the land which pro-

duces them; and are left, for one night only, to sweat, or discharge their moisture, in the open air. On the following day they are deposited in sheds, so constructed as to admit the air on every side, and here they remain, hung at a distance from each other, till they become perfectly dry. They are next spread upon hurdles closely covered, and left to ferment for the space of a week, or a fortnight, after which the leaves are separated from the stalks, and are either put up in barrels, or made into bundles. Tobacco is cultivated in the East Indies, and in Africa; but little, if any, of the article is exported from those countries. In the Levant, Salonica is the grand market for tobacco, whither Syria, the Morea, and Peloponnesus, send what their inhabitants cannot consume. From this port it is sent into Italy, where it is chiefly used in smoking, after its pungency or caustic flavour has been corrected by a mixture with Dalmatian, or Croatian, tobacco. The tobacco of the two provinces of Dalmatia, and Croatia, is of an exceedingly good quality. The Hungarian tobacco is likewise very good, but it yields a disagreeable odour. In the Ukraine, as well as in Livonia, Prussia, and Pomerania, large quantities of this valuable vegetable are grown. The leaf of the tobacco cultivated in these territories, is broader than it is long, is very small, and its strength and odour are of the middling kind. With a view to its amelioration, the Russian government has lately caused some seed brought from Virginia, to be sown in the colonies of Saratow, situated on the Volga. The experiment has not met with the success which might be expected. The tobacco of the Palatine is of itself very indifferent; but it has the rare quality of assuming the flavour of good tobacco whenever the latter is mixed with it. Holland likewise furnishes tobacco: that which grows in the province of Utrecht is of superior quality. The leaf of the Dutch tobacco is large, supple, and unctuous, well coloured, and is capable of communicating its odour to inferior kinds. The worst species of Dutch tobacco is that which is grown in Guelderland. The culture of tobacco was formerly prohibited in France, except in certain parts of that country, such as Pont de l'Arche, Normandy, Verton, Picardy, Montauban, Tonnein, Clerac, and Guyenne, Hainault, Artois, and Franche Comté, which were similarly privileged; but the soil of these provinces was decidedly hostile to the cultivation of the tobacco plant. Alsace produces very indifferent tobacco, but which may be advantageously mixed with any other tobacco of a good flavour. Almost immediately after their first discovery, the islands of the New World produced immense quantities of tobacco; but this species of cultivation soon ceded to that of more valuable productions, except in Cuba, which to the pre-

sent day has continued to supply the Spanish nation with a great part of the tobacco which it consumes. The odour which this tobacco yields is extremely agreeable, and it is therefore generally employed by the Spaniards in making snuff, for the tobacco which they make use of in smoking is generally imported from the Caraccas. This tobacco is also held in high estimation in Holland. At an early period Brazil began to cultivate the tobacco plant, and the inhabitants have hitherto pursued this branch of agriculture with success. The Brazilian tobacco is highly esteemed on the western coasts of Africa, and has obtained good repute in some parts of Europe. It is so very sharp and pungent, that, were it not for the preparation which it undergoes, it could not be taken in the form of snuff. Its pungency is corrected, by each leaf being steeped in a decoction of tobacco and gum-copal. The leaves thus humected, are formed into rolls, and packed in hides, which have the property of preserving them in full perfection for almost any period. North America indubitably yields the finest tobacco in the known world; Virginia produces the best kind of American tobacco; and next to the produce of Virginia may be ranked that of Maryland. The American tobacco is mostly purchased by the Dutch, and the English, especially the latter.

The leaves of the tobacco-plant, taken internally, prove virulently emetic, cathartic, and narcotic: even in the common forms, in which they are employed in such immense quantities, they generally at first disorder the constitution, till habitual use, which subdues many noxious things, has rendered them perhaps innocent, and perhaps even necessary. Distilled in a retort, without addition, they yield an acrid empyreumatic oil, which has been found, from repeated trials, to be poisonous to sundry animals: it is probably on this oil that the effects of the smoke of tobacco depend; for when the plant is set on fire, its native qualities are destroyed.

The laws relative to the importation of tobacco, and the duties from time to time imposed, are continually fluctuating. The most recent provisions on the subject are by statutes 48 Geo. 3. c. 3. & 63. 1 Geo. 4. c. 75. and 1 & 2 Geo. 4. c. 109.: by these acts the duties on tobacco are placed under the management of the commissioners of excise, and various provisions are made for the better securing the same.

The following are the principal regulations for persons dealing in tobacco:

Manufacturers, before they begin to work, are to make entries at the excise office, under penalty of 200*l.*; to cause the words *Manufacturers of Tobacco* to be painted over their doors, in large legible characters; to permit officers to enter by day, or by night, with a constable, and are not to receive any

kind of tobacco without notice to the officer, to whom the manufacturer is to deliver a declaration, specifying the sorts into which the tobacco is to be manufactured.

Persons cutting walnut, hop, or other leaves, in imitation of, or mixing the same with any tobacco, or selling, or offering any such mixture to sale, or having the same in their custody, shall forfeit 200*l.* and all such leaves, &c.

Retail dealers in tobacco are those persons who sell tobacco in less quantities than four pounds, and are subject to similar regulations with manufacturers, as far as relates to permits, entry of officers, &c., in addition to which are the following:

Dealers in tobacco are to enter every day, in one book, all tobacco sold, or consumed, the preceding day, in quantities of four pounds, or upwards; and in another book, all sold in quantities under four pounds, on penalty of 100*l.*

Tobacco-dealers are not to have more than one entry-book in their possession at a time; are to leave their entry-books open for inspection of officers; to enter up the quantities sold each day; and to return such books on oath, in London, every six weeks; and every six months in the country, or sooner, if filled up, on penalty of 100*l.* for refusal, neglect, or false entry.

TOD, a weight by which the quantity of wool is estimated; and is equal to two stone, or 28 pounds.

TOMAN, or TUMEIN, a money of account used by the Persians; and is estimated at about 1*l.* 18*s.*, or 1*l.* 19*s.* sterling. The toman is also a weight used in Persia for weighing money, which in large payments is always received in this manner, and never counted. The toman weighs 50 abassis.

TOMBAC. See PINCHBECK.

TON, an English weight, containing 20 cwt.

TONNAGE, a custom or impost due for merchandise brought, or carried, in tons from, or to, other nations, after a certain rate in every ton.

The usual method of finding the tonnage of any ship is by the following rule: — Multiply the length of the keel by the breadth of the beam, and that product by half the breadth of the beam: and divide the last product by 94, and the quotient will be the tonnage.

Ship's keel 72 feet; breadth of beam 24 feet.

$$\frac{72 \times 24 \times 12}{94} = 120.6 \text{ tonnage.}$$

The tonnage of goods and stores is taken sometimes by weight, and sometimes by measurement; and that method is allowed to the vessel which yields the most tonnage.

In tonnage by weight, 20 cwt. make one ton. In tonnage by measurement, 40 cubic feet are equal to one ton. All carriages, or other stones to be measured by tonnage, are taken to pieces, and packed in the manner which will occupy the least room on board ship. All ordnance, whether brass or iron, is taken in tonnage by its actual weight. Musket-cartridges in barrels or boxes; all ammunition in boxes: and other articles of great weight, are taken in tonnage according to their actual weight. See 13 Geo. 3. c. 74. and 26 Geo. 3. c. 60.

TONNAGE DUTIES OUTWARDS OR INWARDS.

A Tonnage Duty on all Ships or Vessels entering Inwards from, or Outwards for, the following Places (except in Ballast).

TOPAZ. (GER. *Topas*. DU. *Topaas*. DA. and SW. *Topas*. FR. *Topase*. IT. *Topazio*. SP. *Topacio*. PORT. *Topazio*. RUS. *Topas*. POL. *Topazyn*. LAT. *Topasius*.) The name topaz has been restricted by Mr. Haüy to the stones called by mineralogists occidental ruby, topaz, and sapphire; which, agreeing in their crystallisation and most of their properties, were arranged under one species by M. Romé de Lisle. The word topaz, derived from an island in the Red Sea, where the ancients used to find topazes, was applied by them to a mineral very different from ours. One variety of our topaz they denominated *crysolite*.

The colour of the topaz is various, which has induced mineralogists to divide it into the following varieties:

1. Red topaz, of a red colour, inclining to yellow; called Brazilian or occidental ruby.
2. Yellow topaz, of a golden-yellow colour, and sometimes also nearly white; called occidental or Brazil topaz. The powder of this and the following variety, causes syrup of violets to assume a green colour.
3. Saxon topaz. It is of a pale wine yellow colour, and sometimes grayish-white.
4. Aigue marini, of a blueish or pale-green colour.
5. Occidental sapphire, of a blue colour, and sometimes white.

The topaz is found in several parts of the East Indies, in Ethiopia, Arabia, Peru, and Bohemia. The Oriental topazes are most esteemed, whose colour borders on the orange; those of Peru are softer, but their

colour is much the same; the yellow of those of Bohemia is blackish, they are softest of all, and their polish is the coarsest. This gem is easily counterfeited; and there are factitious topazes, to the eye not inferior to the real ones.

TOPGALLANT, or **TOPSAIL**, in a ship, is the highest sail on the mast.

TORNADO, or **TURNADO**, a sudden and vehement gust of wind from all points of the compass, frequent on the coast of Guinea.

TORTOISE-SHELL, (GER. and DU. *Schildpad*. DA. *Skildpaddeskal*. SW. *Sköldpadda*. FR. *Ecaille de tortue*. CARET. IT. *Tartaruga*. SP. *Carey*. COUCHA. PORT. *Tartaruga*. COUCHA. RUS. *Kost tscherepachowaja*. POL. *Skorupa zolwia*. LAT. *Testudinis testa*.) the shell of the testaceous animal called a tortoise; used in inlaying, and in various other works, as for snuff-boxes, combs, &c. Mr. Catesby observes, that the hard strong covering which incloses all sorts of tortoises, is very improperly called a shell; being of a perfect bony contexture, but covered on the outside with scales, or rather plates of a horny substance; which are what workmen call tortoise-shell.

There are two general kinds of tortoises, viz. the land, and sea, tortoise, *testudo terrestris* and *marina*. The sea-tortoise, again, is of several kinds; but it is the *testudo imbricata* of *Linnaeus* alone, which furnishes that beautiful shell so much admired in Europe.

The whole spoils of the tortoise consist in thirteen leaves or scales, eight of them flat, and five a little bent. Of the flat ones, there are four large ones, sometimes a foot long, and seven inches broad. The best tortoise-shell is thick, clear, transparent, of the colour of antimony, sprinkled with brown and white. When used in marquetry, &c. the workmen give it what colour they please by means of coloured leaves which they put underneath it.

Working and joining of tortoise-shell. — Tortoise-shell, and horn, become soft in a moderate heat, as that of boiling water, so as to be pressed, in a mould, into any form, the shell, or horn, being previously cut into plates of a proper size. Two plates are likewise united into one by heating and pressing them; the edges being thoroughly cleaned, and made to fit close to one another. They are conveniently heated for this purpose by applying a hot iron above, and beneath, the juncture, with the interposition of a wet cloth to prevent the shell from being scorched by the irons: these irons should be pretty thick, that they may not lose their heat before the union is effected. Both tortoise-shells, and horns, may be stained of a variety of colours, by means of the colouring-drugs commonly used in dyeing, and by various metallic solutions. See title **HORN**.

TOUCH-NEEDLES, amongst assay-ers, are little bars of gold, silver, and copper,

combined together in all the different proportions and degrees of mixture; the use of which is to discover the degree of purity of any piece of gold, or silver, by comparing the mark it leaves on the touchstone, with those on the bars. The metals usually tried by the touchstone are gold, silver, and copper, either pure or mixed with one another, in different degrees and proportions by fusion. In order to find out the purity or quantity of baser metal in these various admixtures, when they are to be examined, they are compared with those needles, which are mixed in a known proportion, and prepared for this use. The metals of these needles, both pure and mixed, are all made into laminæ or plates, one-twelfth of an inch broad, and a fourth part of their breadth in thickness, and an inch and a half long; these being thus prepared, a mark indicating its purity, or the nature and quantity of the admixture in it, is to be engraved on each.

The method of using the needles, and the stone, is this: The piece of metal to be tried ought first to be wiped well with a clean towel, or piece of soft leather, that you may the better see its true colour; for, from this alone an experienced person will, in some degree, judge beforehand what the principal metal is, and how, and with what, debased. Then choose a convenient part of the surface of the metal, not over large, and rub it several times very hardly and strongly against the touchstone; that in case a deceitful crust or coat should have been laid upon it, it may be worn off by the friction: this, however, may be more readily done by the grindstone, or small file. Then wipe a flat, and very clean, part of the touchstone, and rub against it over and over the substance, till you have, on the flat surface of the stone, a thin metallic crust, an inch long, and about the eighth of an inch broad; this done, look out the needle that seems most like the metal under trial, wipe the lower part of this needle very clean, and then rub it against the touchstone as you did the metal, by the side of the other line, and in a direction parallel to it. When this is done, if you find no difference between the colours of the two marks made by your needle and the metal under trial, you may, with great probability, pronounce that metal and your needle to be of the same alloy, which is immediately known by the mark engraved on your needle. But if you find a difference between the colour of the mark given by the metal, and that by the needle you have tried, choose out another needle, either of a darker, or a lighter, hue than the former, as the difference of the touchstone directs; and by one, or more, trials of this kind, you will be able to determine which of your needles the metal answers, and thence what alloy it is of, by the mark of the needle. If this experiment

fail, it is clear that the alloy is extraordinary, and not to be determined by the comparison of your needles.

TOUCH-STONE. (GER. *Probierestein*. DU. *Toetssteen*. DA. *Provesteen*. SW. *Probersten*. FR. *Pierre de touche*. IT. *Pietra di paragone*. SP. *Piedra de toque*. PORT. *Pedra do tocar*.) The black basalt is used for examining the precious metals by the touch, and hence it has obtained the name of touch-stone. See **BASALTES**, and the foregoing article.

TOW, (GER. *Heede*, *Werg*. DU. *Hede*. DA. *Blaar*. SW. *Blår*. FR. *Etoupe*. IT. *Stoppa*. SP. *Estopa*. PORT. *Estopa*, *Sacudura*. RUS. *Paklā*. POL. *Zgrzebie*.) flax or hemp beaten, and combed into filaments. It is here to be observed that the flax and hemp used for this purpose are but the refuse of such parts of those articles as are employed in the manufacture of cloth, &c. tow being principally applied to the caulking of ships, and to such like coarse purposes.

TOWAGE, the hauling or drawing of a ship, or barge, &c. by men, or beasts, or by another ship or boat fastened to her, in order to her entering a port, or ascending a river, with the greater facility.

TOYS, (GER. *Spielzeug*, *Speilsachen*. DU. *Speelgød*. DA. *Dukketøj*, *Poppentøj*. SW. *Barnlekor*, *Lekdon*. FR. *Jouets*, *Bimbelots*. IT. *Trastulli*. SP. *Dijes*, *Juguetes de niños*. PORT. *Brinquos de criança*, *Dixes*. RUS. *Igrushki*. POL. *Dziecinne igraszki*.) a term which includes every trifling article made expressly for the amusement of children. These articles, of such seeming frivolousness in the estimation of the merely casual observer, employ numberless hands, and give bread to hundreds of families in London and its vicinity, besides occasioning a considerable trade between Great Britain, and Holland. From the latter country we did procure all sorts of toys on much more reasonable terms than we can afford to manufacture them at home. It is said that the toys in which the Dutch deal are, for the most part, made in Germany. Lately these articles have been made in much greater abundance in England.

TRADE. For a general definition of the term, see **COMMERCE**.

For an enumeration of the different branches of trade exercised in the British dominions, and the capitals necessary for beginning to exercise them, see *Appendix*.

TRADE WINDS, or **MONSOONS**. Trade winds are so numerous in every quarter of the world, that our limits will not admit of our even enumerating them. It will be sufficient for our purpose to observe, that they are certain winds which regularly blow in ascertained directions for given periods, in different parts of the world; and are taken advantage of in the course of commerce and navigation. These winds prevail especially in the Indian Seas, and there take

the name of Monsoons. For more particular and philosophical information we must refer the reader to the Cyclopædias, and to books dedicated especially to geography and navigation.

TRAGACANTH. See GUM DRA-GON.

TRAIN-OIL, (GER. *Thran.* DU. *Thraan.* DA. and Sw. *Tran.* FR. *Huile de poisson.* IT. *Olio di pesce.* SP. *Grasa, Aceite de pescado.* PORT. *Azeite de peixe.* RUS. *Salo worwannoe, Worwan.* LAT. *Oleum piscinum*.) a general name for different sorts of fish-oil; such as whale, seal, cod, pilchard, oil, &c. which see under their proper heads. See also FISHERY.

Train-oil is used by leather-dressers, soap-boilers, &c. for burning, &c. Cod-oil is used by curriers, &c. &c. see that article.

TRAM, in weaving silk, is formed by twisting two or more threads of raw silk slack, which is also called the shoot, and forms the breadth of the piece.

TRANSFER, the act whereby one party makes over or assigns his right, interest, or property to another. See ASSIGN, and ASSIGNMENT.

TRANSITU, *Stoppage in.* Where a person has consigned goods by land or water-carriage to another, who may be in insolvent circumstances, the consignor or the person sending the goods, may countermand their delivery, and stop them in their passage, which is termed *stopping in transitu*.

To obtain this remedy, the goods must not be out of the actual, or constructive, possession of the owner; for, if there be any act denoting a complete transfer, or any act of ownership executed by the consignee, the property will be completely vested in such consignee, or, in case of bankruptcy, in his assignees.

TRANSOM, among builders, denotes the piece that is framed across a double-light window.

TRANSOM, in a ship, a piece of timber which lies athwart the stern, between the two fashion-pieces, directly under the gun-room port.

TRASSEL, an Arabian weight, fifteen of which make the Bahar of Mocha, equal to 420 lbs.

TRAY, a well-known article, of indeterminate size, employed for various purposes, more especially for holding tea-equipage, when it is denominated a tea-tray. Trays are made of various substances, particularly silver, mahogany, oak, iron and *papier mache*, japanned or varnished over. Of these, the japanned trays are, at the present day, in the greatest repute, and give rise to the most considerable trade. The *papier mache* trays are far superior to the iron trays; first, because they are lighter, and more elegant, than the latter, and secondly, because they are more durable; their varnish, or surface, not being impaired or broken by contact with

hot liquors, which is not the case with iron-trays. These articles are chiefly manufactured at Birmingham; and some of the paper-trays are so highly finished, and so tastefully adorned with paintings, as to fetch from ten, to thirty, guineas each. Vast quantities of these trays are exported to the continent of Europe, and to North America, where they never fail to meet with good markets. See JAPANING.

TREACLE. (GER. *Theriak.* DU. *Teriakel, Driakel.* DA. *Teriak.* SW. *Theriak.* FR. *Thériakue.* IT. and SP. *Triaca.* PORT. *Triaga.* RUS. *Teriak.* POL. *Dryakiew.* *Teriake.* LAT. *Theriaca.*) See MOLASSES.

TREADLES, of a loom, that part on which the feet tread or act to put the machine in motion.

TREE-MAKER, the mechanic who forms the wooden part of saddles; so named from the tree or chief part of the saddle frame.

TRET, an allowance made for the waste; or dirt, that may be mixed with any commodity. It is usually four pounds, in every hundred and four pounds weight, or the 126th part of the whole.

TRILLION, in arithmetic, a billion of billions.

TRIM, of a Ship, her best posture, proportion of ballast, and hanging of her masts, &c. for sailing. To find the trim of a ship, is to find the best way of making her sail swiftly, or how she will sail best. This is done by easing of her masts and shrouds; some ships sailing much better when they are slack, than when they are tawt or fast; but this depends much upon experience and judgment, and the several trials and observations which the commander and other officers may make aboard.

TRINITY-HOUSE, is a house situated on Great Tower Hill, that belongs to a company or corporation of seamen, who have power, by the king's charter, to correct the faults of sailors, to take cognizance of those that destroy sea-marks, to take care of divers other things belonging to the navigation and the seas, &c. &c. stat. 8 Eliz. 13. 35 Eliz. 6.

TRIPOLI, or ROTTEN-STONE, (GER. and DU. *Tripel.* DA. *Tripel.* SW. *Tripel.* FR. *Tripoli.* IT. *Tripolo.* SP. *Tripoli.* PORT. *Pedra tripe.* RUS. *Trepel.* POL. *Trypola, Trypla.* LAT. *Tripela*.) is known by its quality of rubbing or wearing hard bodies, and making their surfaces shine; the particles of the tripoli being so fine as to leave even no perceptible scratches on the surface. Tripoli tastes like common chalk, and is sandy between the teeth. Its colour is generally yellow. It is brought to us from Tripoli in Barbary, whence its name. There is a species found in Derbyshire, which is in common use here among the workmen, for all sorts of fine grinding and polishing, and is also sometimes used by lapidaries for cutting of stones.

TROUBAHOUACHE, called also *moncha*, or *monka*, a measure used by the inhabitants of Madagascar, for their husked rice, containing nearly six pounds of that grain.

TROY-WEIGHT, one of the most ancient of the different kinds used in Britain. The ounce of this weight was brought from Grand Cairo in Egypt, about the time of the crusades, into Europe, and first adopted in Troyes, a city of Champagne, whence the name. The pound English troy contains 12 ounces, or 5760 grains. It was formerly used for every purpose; and is still retained for weighing gold, silver, and jewels; in some degree for compounding medicines; for experiments in natural philosophy; and for comparing different weights with each other.

TROY-WEIGHT, *Scots*, was established by James VI. in the year 1618, who enacted, that only one weight should be used in Scotland, viz. the French troy stone of 16 pounds, and 16 ounces in the pound. The pound contains 7600 grains, and is equal to 17 oz. 6 dr. avoirdupois. The cwt. or 112 lb. avoirdupois, contains only 103 lb. 2½ oz. of this weight, though generally reckoned equal to 104 lb. This weight is nearly, if not exactly, the same as that of Paris, and Amsterdam; and is generally known by the name of Dutch weight. Though prohibited by the articles of union, it is still used in weighing iron, hemp, flax, most Dutch, and Baltic, goods, meal, butchers'-meat, unwrought pewter, and lead, and some other articles.

TRUFFLES, (*GER. Trüffel. DU. Tartuffels. DA. Trüfler. SW. Häräplen. FR. Truffes, Trufles. IT. Tartufi, Tartuffole. SP. Criadillas de Turmas de tierra. PORT. Tortulhos. POL. Tartufole, Tubera*.) a kind of vegetables, not unlike mushrooms. Some of them are very large, many being found to weigh from a pound, to a pound and a quarter. They grow principally in Germany, Italy, and several parts of France. Truffles, when dried, are used in ragouts; but they are said to be extremely difficult of digestion, and consequently very unwholesome as an article of food.

TRUNNIONS, or *TRUNIONS*, of a piece of ordnance, are those knobs or bunches of the gun's metal, which bear her up on the cheeks of the carriage; and hence the trunnion-ring is the ring about a cannon, next before the trunnions.

TRUSS, a bundle, or certain quantity, of hay, or straw. Fifty-six pounds of *old hay* make a truss, whereas sixty pounds of *new hay* go to the truss. Thirty-six trusses, either of new, or old, hay, go to the load. Of straw, thirty-six pounds make the truss, and thirty-six trusses the load.

TRUSSES, in a ship, are ropes made fast to the parrels of a yard, either to bind the yard to the mast when the ship rolls, or to hale down the yards in a storm, &c.

TRUST, is a right to receive profits of land, and to dispose of the land in equity. And one holding the possession and disposing of it at his will and pleasure, are signs of trust. * *Chan. Rep. 52.*

A trust is but a new name given to an use, and invented to evade the statute of uses. 21 *Vin. 493.*

What is a declaration of trust, and when a trust shall be raised.—By stat. 29 C. 2. c. 3. all declaration or creation of trust shall be manifested by some writing signed by the party, or by his last will in writing, or else shall be void. And by sect. 9. of the same act, assignments of trust shall be in writing, signed by the party assigning the same, or by his last will, or else shall be of no effect.

What shall be deemed a trust by implication.—By 29 Car. 2. all declarations of trusts were to be made in writing; but in the said act there is a saving with regard to trusts resulting by implication of law, which are left on the footing whereon they stood before the act; now a bare declaration by parole before the act, would prevent any resulting trust. 2 *Vern. 294.*

If a man purchases land in another's name, and pays the money, it will be a trust for him that paid the money, though no deed is made.

TRUSTEE, one who has an estate, or money, put or trusted in his hands, for the use of another. Where two, or more, persons are appointed trustees, if one of them only receives all, or the greater part of, the profits of the lands, &c. and is in arrear, and unable to satisfy the person to whom he is seised in trust, the other, in that case, shall not be answerable for more than comes to his hands.

TSIN, a name given by the Chinese to a stone used in their manufacture of porcelain ware.

This is of a deep blue colour, considerably resembling Roman vitriol, and is found in lead mines, and supposed to contain some particles of lead; its effects being the same in the porcelain, as those of ceruse or white lead, in making the other colours penetrate into the substance of the vessels.

The deep violet colour which appears so beautiful in China ware, is usually made with this stone, which is found about Canton, and Pekin, but chiefly the latter. The painters in enamel melt this stone, and use it considerably; they make many beautiful works by laying it upon silver; but it is too apt to come off by time.

TUN, or *Ton*, originally signifies a large vessel or cask of an oblong form, biggest in the middle, and diminishing towards its two ends, girt about with hoops, and used for stowing several kinds of merchandise, for convenience of carriage; as brandy, oil, sugar, skins, hats, &c. This word is also used for certain vessels of extraordinary bigness, serving to keep wine for several years.

TUN, is likewise a certain measure for liquids; as wine, oil, &c. The tun of wine contains two pipes, or two hundred and fifty-two gallons; and the tun used in the measurement of spirits, cider, perry, and vinegar, is precisely the same.

The tun of oil is 236 gallons, and the ton weight is 20 cwt.

TUNNY. (GER. *Tunfisch*, *Thunfisch*. DU. *Thonyn*. DA. *Tanteie*. SW. *Spansk makrill*. FR. *Thon*. IT. *Tonno*. SP. *Atun*. PORT. *Atum Tom*. LAT. *Thynnus*.) See **TUNNY**, article **FISHERY**.

TURKEY-COMPANY. See **COMPANY**.

TURKOISE, or **TURQUOISE**. (GER. *Türkiss*. DU. *Turkois*. DA. *Turkis*. SW. *Turkos*. FR. *Turquoise*. IT. *Turchina*. SP. *Turquesa*. PORT. *Turqueza*. RUS. *Birusa*. POL. *Turkus*. LAT. *Turkosa*.) This was formerly ranked among the gems, and employed in various articles of jewellery; but, though it is still considered as of some value, of late years it is less esteemed.

The turquoise comes chiefly from Persia. Its specific gravity is 3.127. Colour light green, or blue; surface smooth and polished; hardness such as slightly to scratch glass: difficult to pulverise, and of a greenish-grey when reduced to powder: its fracture polished.

TURMERIC. See **CURCUMA**.

TURNING, the art of forming hard bodies, as wood, ivory, or iron, into a round or oval shape, by means of a machine called a lathe.

The lathe should be fixed in a place very well lighted; it should be immoveable, and neither too high, nor too low. The puppets should neither be so low as to oblige the workman to stoop in order to see his work properly, nor so high that the little chips, which he is continually driving off, should come into his eyes. See **LATHE**.

The piece to be turned should be rounded (if it is wood) before it is put on the lathe, either with a small hatchet made for the purpose, or with a plane, or with a file, fixing it in a vice, and shaving it down till it is every where almost of an equal thickness, and leaving it a little larger than it is intended to be when finished off. Before putting it on the lathe, it is also necessary to find the centre of its two end surfaces, and that they should be exactly opposite to each other, that when the points of the puppets are applied to them, and the piece is turned round, no side may belly out more than another. To find these two centres, lay the piece of wood to be turned upon a plank; open a pair of compasses to almost half the thickness of the piece, fix one of the legs in the plank, and let the point of the other touch one of the ends of the piece, brought into the same plane with the plank on which the compasses are fixed, and very near the fixed leg. Describe four arcs on that end,

at equal distances from each other, at the circumference of the end, but intersecting one another within: the point of intersection is the centre of the end. In the same manner must the centre of the other end be found. After finding the two centres, make a small hole at each of them, into which insert the points of the puppets, and fix the piece so firmly as not to be shaken out, and yet loose enough to turn round without difficulty.

The piece being thus fixed, it is necessary in the next place to adjust the cord, by making it pass twice round the piece, and in such a manner, that the two ends of the cord, both that which is fixed to the spang, and to the footboard, come off on the side on which the turner stands, that the piece may move against the edge of the cutting-tool and be turned. If the lathe is moved by a wheel, the manner of adjusting the cord needs no direction.

If the workman does not choose to be at the trouble to find the two centres of the piece in the manner described above, let him lay, as nearly as he can, the centre of one end upon the point of the left-hand puppet, and then let him push forward the right-hand puppet, striking it with a mallet till its point is as near as can be in the centre of the other end of the piece; and then fixing the right-hand puppet by a gentle blow of the mallet on the key, let him turn round the piece to see by the eye if the centres have been properly found. If any part of it bellies out, let him strike that part gently with the mallet till it goes properly; then let him strike one of the puppets pretty smartly to drive the points into the piece, and afterwards fix the puppet by striking the key. If the workman cannot judge by the eye whether the piece be turning properly round its centres, or not, he should apply gently the point of an instrument called a triangular graver, leaning it on the rest, and it will mark by a line the place where the piece is out of its centre; and by striking upon this line with a mallet, the piece can easily be placed properly. The rest, of which we have just spoken, ought to be placed upon the two arms of the lathe, and fixed with screws as near the piece as the workman pleases.

The piece being fixed between the two points of the puppets, the cord adjusted, and the rest fixed as near the work, as possible, without touching it; the workman is now to take a gouge of a proper size in his left hand, and hold it by the handle a little inclined, keeping the back of the hand lowermost. With his right hand, the back of which is to be turned upwards, he is to grasp it near the end on this side of the rest; then leaning the gouge on the rest, he is to present the edge of it a little higher than the horizontal diameter of the piece, so as to form a kind of tangent to its circumference; then putting the right foot on the footboard, and turning round the wheel, and holding

the gouge firmly on the rest, the piece will be cut neatly. In the same manner are the chisels, formers, and other instruments to be used, taking care that the wood shall be cut equally, and that the instrument shall not be pushed improperly, sometimes stronger than at others; and taking care also, that the instrument used do not follow the work, but that it is kept firmly in the hand without yielding.

The young turner ought to endeavour to acquire the management of the gouge and the chisel, which are the instruments by far the most frequently used, and the most necessary in this art: by them, almost entirely, are the soft woods turned; as for hard woods and other things, as box, ebony, horn, ivory, and the metals, they are hardly ever turned, except by shaving off. In that case gravers are to be used with square, round, or triangular mouths. They should be held horizontally while applied to the material, and not obliquely as directed for the gouge and the chisel.

After the work is completely turned, it is next to be polished. Soft woods, as pear-tree, hazel, and maple, ought to be polished with shark-skin, or Dutch rushes. There are different species of sharks; some of which have a greyish, others a reddish, skin. Shark-skin is always the better to be a good deal used; at first it is too rough for polishing. The Dutch rush is the *equisetum hyemale* of Linnaeus, which grows in moist places among mountains. It is remarkable for having flinty particles in the substance of its leaves, which render it so useful in polishing. It has a naked, simple, and round, stem, about the thickness of a writing pen. The oldest plants are the best. Before using them they should be moistened a little, otherwise they break in pieces almost immediately, and render it exceedingly difficult to polish with them. They are particularly proper for smoothing hard woods, as box, lignum-vitæ, ebony, &c. After having cleaned the piece well, it should be rubbed gently, either with wax, or olive-oil, then wiped clean, and rubbed with its own raspings, or with a cloth a little worn. Ivory, horn, silver, and brass, are polished with pumice-stone finely pounded and put upon leather or a linen cloth a little moistened: with this the piece is rubbed, as it turns round in the lathe; and to prevent any dirt from adhering to any part of it, every now and then it is rubbed gently with a small brush dipt in water. To polish very finely, the workmen make use of tripoli, and afterwards of putty, or calx of tin. Iron, and steel, are polished with very fine powder of emery; this is mixed with oil, and put between two pieces of very tender wood, and then the iron is rubbed with it. Tin, and silver, are polished with a burnisher, and that kind of red stone called in France *sanguine dune*. They may be polished also with putty, putting it dry

on shammy-skin, or with the palm of the hand.

To succeed in turning iron, it is necessary to have a lathe exceedingly strong in all its parts, and exceedingly well fixed. The puppets should be short, and the rest well fixed very near the work; the back of the rest should be two or three lines lower than the iron to be turned.

The lathe, and other instruments, being prepared, it is necessary to determine the length, and thickness, of the iron to be turned, according to the design which is to be executed, and to make a model of it in wood a little thicker than it ought to be; then one exactly like this is to be forged of the best iron that can be procured; that is, it must not be new, but well prepared, and well beaten with hammers; it must have no flaws, nor cracks, nor pimples. New iron, which has not been well beaten, often contains round drops of cast iron, called by the workmen grains, which blunt the edges of the gouges, chisels, and other instruments used for cutting; break them, or make them slide. The iron being forged according to the model, it should be annealed, that is, heated red hot, and allowed to cool slowly on the coals till the fire goes out of itself. Some people, to soften the iron, cover it over with clay, and allow it to cool. The iron cylinder being thus made, it is next to be put upon the lathe, finding the centres as formerly directed, and boring a small hole in them, that the iron may not escape from the points.

The points should be oiled, from time to time, to prevent their being excessively heated, and spoiled while the iron is turned. A crotchet is then to be applied to the iron to be turned a little above its centre, pretty gently, and by this means the inequalities of the cylinder will be taken off. Other instruments are then to be applied to mould the iron according to the model; and whenever any of them grow hot, they are to be plunged into a bason of water lying beside the workman. If the iron, after being properly turned, is to be bored like a gun barrel, one of the puppets is to be removed, and another substituted in its place, having a square hole through it, into which the collar of the iron is to be fixed firmly, so as not to shake; then borers are to be applied, like those which locksmiths use to bore keys; and beginning with a small one, and afterwards taking larger ones, the hole is to be made as wide and deep as necessary; great care must be taken to hold the borers firm to the rest, otherwise there is danger of not boring the hole straight. The borer must be withdrawn, from time to time, to oil it, and to clean the hole. Since it is difficult to make a hole quite round with borers alone, it is necessary to have also an instrument a good deal smaller than the hole, one of the sides of which is sharp, very well tempered, and a little hollow in the middle. This instru-

ment being fixed in a pretty long handle, is to be applied with steadiness to the inner surface of the hole, and it will entirely remove every inequality that may have been there before its application.

For turning ovals, a lathe of somewhat a different construction is used. The axis or spindle, having on it the pulley, over which the hand-cord passes, for turning the lathe, is fixed between the two puppets so as to turn round easily; one end of it passes through one of the puppets, and to it is firmly fixed a circular plate of brass, so that it turns round along with the spindle. Upon this plate two brazen segments of circles are fastened, the circumferences of which correspond to the circumference of the plate; their cords are parallel, and equally distant from the centre of the plate, so that they leave a distance between them. They have a groove in each of them; in these grooves another plate is placed, which exactly fills up the space between the two grooves, but is shorter than the diameter of the larger circular plate on which it is laid. This plate is made to slide in the grooves. To its centre is annexed a short spindle, on which the piece of wood to be turned, is fixed. When the lathe is set a going, the circular plate moves round, and carries the piece along with it; the plate of brass, on which the piece is placed, being fixed loosely in the grooves already described, slides down a little every time that the grooves become perpendicular to the floor (and there are particular contrivances, to prevent it from sliding down too far); and by these two motions combined, the circular one of the large plate, and the straight one of the small, the circumference of the piece of wood to be turned necessarily describes an oval; and gouges, or other tools being applied in the usual manner, supported on the rest, it is cut into an oval accordingly. The small plate may be made to slide, either more or less, in the grooves; and by this contrivance, the transverse diameter of the oval, or rather ellipse, may be made longer or shorter, at pleasure. Another, and still more simple method, if possible, of turning ovals, is this: Take two ovals of metal, exactly of the size of the oval which you intend to make; fix them firmly on the spindle of the lathe, so as to turn round with it; fix between them the wood to be turned, and then it is easy, by the help of chisels, and other tools, to cut it, as the lathe goes, into exactly the figure of the external ovals. Or an oval may be formed by placing the wood, or whatever is to receive that shape, obliquely on the lathe. There are several other ingenious methods of turning; but our bounds do not permit us to enter upon them.

TURNSOL, (GER. *Turnesol*, *Tornesol*. DU. *Tournesol*. DA. *Tornesol*, *Jarvelap*. SW. *Tornisoll*. FR. *Tournesol en drapeaux*. IT. *Tornasole*. SR. *Tornasol*, *Irasol*. PORT,

Tornasol), a valuable dyeing drug, which is prepared chiefly in the village of Grand Garlagues, near Montpellier, from the *croton tinctorum*, L. in French called *marelle*.

Toward the latter end of July, or early in August, the flowering tops of this plant are expeditiously collected and bruised; when the dark green sap is expressed into stone vessels, with the addition of urine; linen, or woollen, rags are next dipped into this liquor, and immediately dried in the sun, after which they are suspended for seven, or eight, hours, over casks containing stale urine, quick lime, and alum, till they acquire a blue, or dark violet, colour, and if necessary, are again immersed in the juice, dried, and treated as before; thus prepared, they are packed, and sold by the French, under the name of *tournsols en drapeaux*: these blue shreds are chiefly employed for tinging wines, linen, and paper: when infused with distilled water, they afford an excellent test for the detection of acids; for, on pouring a little of this solution into any liquor containing an acid, it will instantly turn red.

TURPENTINE, (GER. *Turpentin*. DU. *Terpentin*. DA. and SW. *Terpentin*. FR. *Terebinthine*. IT. and SP. *Trementina*. PORT. *Terebenthina*. RUS. *Skipidar*. POL. *Terpentina*. LAT. *Terebinthina*), a resinous juice extracted from several species of trees. The true turpentine tree is found in Spain and the southern parts of France, as well as in the island of Chio, and in the Indies. It is a middling sized ever-green, with leaves like those of the bay, bearing purplish, in perfect flowers; and on separate pedicles, hard unctuous berries, like those of the juniper. It is extremely resinous; and unless the resin is discharged, it decays, produces fungous excrescences, swells, bursts, and dies; the prevention of which consists wholly in plentiful bleeding both in the trunk and branches. The juice is the *Chio* or *Cyprus Turpentine* of the shops. This sort is quite of a thick consistence, of a greenish colour, clear and transparent, and of scarcely any taste, or smell.

The kind now called *Venice Turpentine* is no more than a mixture of eight parts of common yellow, or black, rosin, with five parts of oil of turpentine. The resin or gum which exudes from the larch-tree is occasionally denominated *Venice turpentine*. This has a strong smell, and a hot disagreeable taste, it is less viscid than any of the other turpentine, and generally of a clear whitish, or yellowish, cast.

The *Strasburg Turpentine* is extracted from the silver fir. It possesses an agreeable aromatic odour, and an uncommonly bitter taste, is neither so thick as the former species, nor so thin as the latter, but it is clearer, and less tenacious than either, being commonly of a yellowish brown colour; it is imported from Germany.

The common *Turpentine* is prepared from different sorts of the pine, and is quite thick, white, and opaque. The process of making it is as follows. In the spring, when the sap runs most freely, the bark of the pine is pared off, to make the sap run down in a hole at the bottom, cut to receive it. As it runs down it leaves a track of white matter, like cream, but rather thicker. This is widely different from all kinds of rosin and turpentine in use, and is generally employed in the making of flambeaux, instead of white bees-wax. The matter, that is received in the hole at the bottom of the tree, is taken up with ladders, and put into a large basket. A great part of this immediately runs through, and is the common turpentine. It is received in stone or earthen pots, and is not otherwise prepared for sale. Although considerable quantities of turpentine are prepared in Great Britain, they are insufficient to supply the market, on which account abundance of the article is imported from America, and the Baltic.

Turpentine is of considerable utility in pharmacy, and is much used by farriers, &c. as a stimulant application to wounds.

TURPENTINE, Oil of; (GER. *Terpentinöl*. DU. *Terpentinolie*. DA. *Terpentinolja*. SW. *Terpentinaolja*. FR. *Eau de raze, Huile de terebenthine, Huile d'etherée*. IT. *Acqua di rasa*. SP. *Aguarras*. PORT. *Aguaras*. RUS. *Skipidarnoe masslo*. POL. *Olej Terpentinowy*.) is the essential oil drawn from turpentine by distillation: there are two sorts of this oil; the best red, and the second white, and both esteemed excellent balsams for the cure of wounds, though they are more frequently used by painters than by apothecaries. It is of great use as a remedy for burns or scalds; the part injured is to be well bathed with it, or a poultice formed with bread and oil of turpentine, and applied to the injured part.

The essential oil of the common turpentine is said to be used by distillers in the preparation of gin; it is also employed by house-painters, and also for the different varnishes in the floor-cloth, umbrella, and many other manufactures.

Oil of turpentine should be chosen clear like fair water, and of a strong and penetrating odour. It is subject to great adulteration, and is so highly inflammable, that great precaution ought to be observed in approaching it with fire.

TUTENAG, Indian zinc, or a mixed metal composed chiefly of zinc: it is formed into blocks of about twenty pounds each.

TUTTY, (GER. *Ofenbruch*. DU. *Ovenbreuk*. DA. *Ovnbrud*. SW. *Unggods*. FR. *Cadmie des fourneaux*. IT. *Turzia*. SP. *Tucia*, *Tutia*. PORT. and LAT. *Lapis Tutia*.) an argillaceous ore of zinc, found in Persia. The better sorts of tutty are in semicylindrical concave pieces, like the bark of a tree; ponderous and somewhat sonorous; moderately compact, and generally not easy to break; of an ash or mouse-grey colour, often with yellow or green variations, pretty smooth on the inside, full of cavities or protuberances on the outside. The entire, compact, grey pieces are preferred; the broken, powdery, crumbly, yellow, or reddish, rejected. Boecler relates, that tutty has a sharp taste, but no such taste is perceptible in ours.

It is used with us as an absorbent application in diseases of the eyelids; in India, as a cosmetic for destroying superfluous hairs.

TYPE, among letter-founders and printers, is the same with letter. For the mode of casting types, see **LETTER-FOUNDER**; for the foreign names of the article, see **PRINTING-TYPES**.

VAL

U or **V**, THE twentieth letter of the alphabet. In numerals V stands for five, and with a dash at top thus, V signifies 5000.

VAL, a small Indian weight, used for weighing dollars, or pieces of eight, each of which ought to weigh 75 vals. It is also used for weighing gold ducats, which must weigh nine vals, and 5-16ths of an Indian carat, and whatever is wanting of these weights in either, must be made good by the vender.

VALERIAN, *Valeriana*, a plant, of which there are 31 species, only four of which are natives of Britain, the *officinalis*, the *olitoria*, the *rubra*, and the *dioica*; of these only the *officinalis* is useful. The

VAL

root of this plant is perennial: the stalk is upright, smooth, chanced, round branched, and rises from two, to four, feet in height; the leaves on the stem are placed in pairs upon short broad sheaths; they are composed of several lance-shaped, partially dentated, veined, smooth pinnæ, with an odd one at the end, which is the largest; the floral leaves are spear-shaped and pointed; the flowers are small, of a white or purplish colour, and terminate the stem and branches in large bunches. It flowers in June, and grows commonly about hedges, and woods. It was first brought into estimation in convulsive affections, by Fabius Columna, who relates that he cured himself of an epilepsy by the root of this plant. The advantages

said to be derived from this root in epilepsy, caused it to be tried in several other complaints termed nervous, particularly those produced by increased mobility, and irritability of the nervous system, in which it has been found highly serviceable. The root in substance is most effectual, and is usually given in powder from a scruple, to a drachm; its unpleasant flavour may be concealed by a small addition of mace.

VALONIA, (GER. *Akerdoppen*. DU. *Akerdoppen*. FR. *Avelanedc*. IR. *Vallonea*, *Valonia*,) the husks of the acorn, generally were mixed with that fruit, though this diminishes its value. It is brought to us from Italy, and the Levant, and used as a dyeing ingredient.

VALUE, the price or worth of any thing.

Intrinsic value denotes the proper, real, and effective, worth of any thing, and is chiefly used with regard to money; the popular value whereof may be raised, and lowered, at the pleasure of the prince, but its real or intrinsic value, depending wholly on its weight, and fineness, is not at all affected by the stamp or impression thereon.

VALUE, in bills of exchange. The words "*value received*," though usually inserted in bills of exchange, and promissory notes, are nevertheless not essential to the validity of negotiable instruments, unless in particular cases; for value received is as much implied upon the face of every negotiable instrument, as if these words had been actually expressed. *Chitty, on bills*, &c. 50. By 9 & 10 Will. 5. c. 17. & 3 & 4 Ann. c. 9. s. 4. the holder cannot recover interest, and damages, against the drawer and indorser in default of acceptance or payment, unless the bill contain the words *value received*; on this account, therefore, it is at all times advisable to insert these words. See **BILLS OF EXCHANGE**.

VAN DIEMEN'S LAND. An island 100 miles long, 50 broad, separated from New Holland by a strait 50 leagues wide, situate at the southern extremity of New Holland, between 40° 42' and 43° 43' of south latitude, and between 145° 51' and 148° 22' of east longitude.

Derwent, Heron, and Tamer, large rivers.

Ports — Derwent, Davy, Macquane, Dalrymple, and Oyster Bay, very fine harbours. It has now copper, alum, coals, slate, lime-stone, asbestos, and basaltes.

Hobart Town, seat of government.

A mountain, supposed 6000 feet above the level of the sea, called Table Mountain, so named after that of the Cape of Good Hope. — *W. C. Wentworth's Statistical Account of this Colony*.

VANE, in a ship, &c. a thin slip of some kind of matter, placed on high in the open air, turning easily round on an axis or spindle, and veered about by the wind, to shew its direction or course.

VANILLA, (GER. *Vanilje*. DU. *Ba-*

nilje. DA. *Vaniller*. SW. *Baniller*. FR. *Vanille*. IR. *Vainiglia*. SP. *Vainilla*, *Vainica*. PORT. *Vainilha*, *Baonilha*. LAT. *Vanilla*.) There are 124 species of the vanilla plant, one of which produces this fruit, which is used in making chocolate. It is a native of Mexico, and also of some parts of the East Indies. It is a parasitic plant, the leaves of which greatly resemble the vine, and are about eighteen inches long, and three inches broad. The flowers are of a white colour, intermixed with stripes of red, and yellow. When these fall off they are quickly succeeded by the pods, which at first are green, but afterwards, as they ripen, become yellow, and are gathered for use. The pods of the best vanilla are long, slender, and well filled with seeds. If opened when fresh, the cavity of the pod is found to contain a humid substance that is black, oily, and balsamic, of such a strong smell, that it frequently causes head aches, and even a sort of temporary intoxication.

The season for gathering the pods begins about the end of September, and lasts till the end of December. They are dried in the shade; and when dry, and fit for keeping, they are rubbed externally with a little oil, cocoa, or calba, to render them supple, or to preserve them the better, and to prevent them from becoming too dry or brittle. The use of this fruit is only for perfuming chocolate. In New Spain it is reckoned unwholesome, and therefore never used; but in England, and other countries of Europe, it is a constant ingredient, and perhaps its noxious qualities may be corrected by the sea air. In those countries where they grow, the plants are very easily propagated by cuttings. In this country they require to be kept in a stove, and also to be placed near some American tree, round which they may climb for support.

The high perfume of the vanilla is easily extracted by spirit of wine; a short infusion in this menstruum, serves to give it a very rich and highly-flavoured tincture, and the remaining vanillas, when the liquor is thoroughly pressed from them, have no smell. When analysed, the vanilla yields a very large portion of an aromatic essential oil, a moderate quantity of an acid phlegm, and a small portion of an urinary liquor, and fixed salt.

VARI, a small weight used among the ancient inhabitants of Madagascar, equal to half a dragma marc; here is likewise the *sompe*, *saccare*, *nanqui*, and *nanque*; all used for weighing gold and silver only.

VARIATION, in navigation, is the deviation of the magnetical needle in the mariner's compass, from the true north point, towards either the east, or west; or it is an arch of the horizon, intercepted between the meridian of the place of observation, and the magnetic meridian.

VARNISH, (GER. *Firniss*. DU. *Fernis*.

DA. *Fernis*. SW. *Fernissa*. FR. *Vérnis*. IT. *Vernice*. SP. *Barniz*. PORT. *Verniz*. RUS. *Olifa*. POL. *Pokost*. LAT. *Vernix*, a thick, viscid, shining liquor, used by painters, gilders, and various other artificers, to give a gloss and lustre to their works; as also to defend them from the weather, dust, &c.

Varnish ought to possess the following properties: it must exclude the action of the air, because wood and metals are varnished to defend them from decay and rust. It must resist water, for otherwise the effect of the varnish could not be permanent. It ought not to alter such colours as are intended to be preserved by this means. It is necessary, therefore, that a varnish should be easily extended, or spread over, the surface, without leaving pores or cavities; that it should not crack, or scale, and that it should resist water.

Varnishes should be carefully kept from dust, and in very clean vessels; they should be laid as thin and even, as possible, with a large flat brush, taking care to lay the strokes all one way. A warm room is best for varnishing in, as cold chills the varnish, and prevents it from lying even.

Varnishes are polished with pumice-stone, and tripoli. The pumice-stone must be reduced to a very fine powder, and put upon a piece of serge moistened with water: with this the varnished substance is to be rubbed equally, and lightly. The tripoli must also be reduced to a fine powder, and put upon a clean woollen cloth moistened with olive-oil, with which the polishing is to be performed. The varnish is then to be wiped with soft linen, and, when quite dry, cleaned with starch or Spanish white, and rubbed with the palm of the hand, or with a linen cloth.

Fat Oil Varnish. Fixed, or fat oil, will not evaporate, nor will it become dry of itself. To make it dry it must be boiled with metallic calces or oxides. Litharge is generally used for this purpose. Oil so prepared is called drying oil. To accelerate the drying of oil-varnish, oil of turpentine is added. Gum-copal, and amber, are the substances principally employed in oil-varnishes; the copal being whitest, is used for varnishing light; the amber for dark colours. It is best to dissolve them before mixing with the oil; because, by so doing, they are in less danger of being scorched, and, at the same time, the varnish is more beautiful. They should be melted in an iron pot over the fire; they are in a proper state for receiving the oil when they give no resistance to the iron spatula, and when they run off from it drop by drop.

To make oil varnish, pour four, six, or eight, ounces of drying oil, among sixteen ounces of melted copal, or amber, by little and little, constantly stirring the ingredients at the same time with the spatula. When the oil is well mixed with copal, or amber, take it off the fire; and when it is pretty

cool, pour in sixteen ounces of the essence of Venice turpentine. After the varnish is made it should be passed through a linen cloth.

Oil-varnishes become thick by keeping; but when they are to be used it is only necessary to pour in a little Venice turpentine, and to put them a little on the fire. Less turpentine is necessary in summer than in winter; too much oil hinders the varnish from drying, but when too little is used, it cracks, and does not spread properly.

White varnish for clock-faces, &c. Take of spirit of wine (highly rectified) one pint, which divide into four parts, then mix one part with half an ounce of gum-mastich, in a phial; one part of spirit, and half an ounce of gum-sandarach, in another phial; one part of spirit, and half an ounce of the whitest parts of gum-benjamin. Then mix and temper them to your mind. It would not be amiss to add a little bit of white resin, or clear Venice turpentine, in the mastich bottle: it will assist in giving a gloss. If your varnish proves too strong and thick, add spirit of wine only; if too hard, some dissolve mastich, if too soft, some sandarach or benjamin. No other rule can be given, unless the quality of the gums and the spirit could be ascertained. When you have brought it to a proper temper, warm the silvered plate before the fire, and with a flat camels' hair pencil stroke it all over till no white streaks appear.

Black varnish for coaches and iron work. This varnish is composed of asphaltum, resin, and amber, melted separately, and afterwards mixed; the oil is then added, and afterwards the turpentine, as already directed. The usual proportions are, twelve ounces of amber, two of resin, two of asphaltum, six of oil, and twelve of turpentine.

A varnish for rendering silk water, and air, tight. To render the linseed oil drying, boil it with two ounces of sugar of lead, and three ounces of litharge, for every pint of oil, till the oil has dissolved them; then put a pound of bird-lime, and half a pint of the drying-oil, into a pot of iron or copper, holding about a gallon; and let it boil gently over a slow charcoal fire, till the bird-lime ceases to crackle; then pour upon it two pints and a half of drying oil, and boil it for an hour longer, stirring it often with an iron or wooden spatula. As the varnish, in boiling, swells much, the pot should be removed from the fire, and replaced when the varnish subsides. While it is boiling, it should be occasionally examined, in order to determine whether it has boiled enough. For this purpose, take some of it upon the blade of a large knife, and after rubbing the blade of another knife upon it, separate the knives, and when, on their separation, the varnish begins to form threads between the two knives, it has boiled enough, and should be removed from the fire. When it is almost cold, add about as

equal quantity of spirit of turpentine; mix both well together, and let the mass rest till the next day; then, having warmed it a little, strain and bottle it. This varnish should be laid upon the stuff when perfectly dry, in a lukewarm state; a thin coat of it upon one side, and about twelve hours after, two other coats should be laid on, one on each side, and in twenty-four hours the silk may be used.

Blanchard's varnish for air-balloons. Dissolve elastic gum (caoutchouc, or Indian rubber,) cut small, in five times its weight of spirit of turpentine, by keeping them some days together: then boil an ounce of this solution in eight ounces of drying linseed oil, for a few minutes, and strain it. Use it warm.

Essential oil varnish. The essential varnish consists of a solution of resin in oil of turpentine, or other essential oil. This varnish being applied, the turpentine evaporates, leaving the resin behind. It is commonly used for pictures.

Spirit varnishes. When resins are dissolved in alcohol, commonly called spirit of wine, the varnish dries very speedily, but is subject to crack. This fault is corrected by adding a small quantity of oil of turpentine, which renders it brighter, and less brittle when dry.

A varnish for toilet boxes, cases, &c. Dissolve two ounces of gum mastich, and eight ounces of gum-sandarach, in a quart of alcohol; then add four ounces of Venice turpentine.

A varnish for wainscot, cane-chairs, &c. Dissolve in a quart of spirit of wine, eight ounces of gum-sandarach, two ounces of seed-lac, and four ounces of resin; then add six ounces of Venice turpentine. If the varnish is to produce a red colour, more of the lac, and less of the sandarach should be used, and a little dragon's blood should be added. This is a very strong varnish.

A varnish for violins and other musical instruments. Put four ounces of gum-sandarach, two ounces of lac, two ounces of gum-mastich, an ounce of gum-elemi, into a quart of alcohol, and hang them on a slow fire till they are dissolved, then add two ounces of turpentine.

A varnish for employing vermilion for painting equipages. Dissolve in a quart of alcohol six ounces of sandarach, three ounces of gum-lac, and four ounces of resin, afterwards six ounces of the cheapest kind of turpentine; mix it with a proper quantity of vermilion when it is to be used.

Seed-lac varnish. Take spirit of wine one quart, put it in a wide-mouthed bottle, add to it eight ounces of seed-lac, that is large-grained, bright, and clear, free from dirt and sticks; let it stand two days or longer, in a warm place, often shaking it. Strain it through a flannel into another bottle, and it is fit for use.

Shell-lac varnish. Take one quart of spirit of wine, eight ounces of the thinnest, and most transparent, shell-lac, which, if melted in the flame of a candle, will draw it out in the finest, and longest, hair; mix and shake these together, and let them stand in a warm place for two days, and it is ready for use. This varnish is softer than that which is made from seed-lac, and therefore is not so useful, but may be mixed with it for varnishing wood, &c.

To dissolve gum-copal in spirit of wine. Dissolve half an ounce of camphor in a pint of alcohol, or spirit of wine, put it into a circulating glass, and add four ounces of copal in small pieces, set it in a sand-heat, so regulated that the bubbles may be counted as they rise from the bottom; and continue the same heat till the solution is completed.

Camphor acts more powerfully upon copal, than any other substance. If copal be finely powdered, and a small quantity of dry camphor rubbed with it in the mortar, the whole becomes, in a few minutes, a tough coherent mass. The process above described will dissolve more copal, than the menstruum will retain when cold. The most economical method will therefore be, to set the vessel which contains the solution by for a few days; and when it is perfectly settled, pour off the clear varnish, and leave the residuum for a future operation. This is a very bright solution of copal; it is an excellent varnish for pictures, and may perhaps be found to be an improvement in fine japan works; as the stoves used in drying those articles may drive off the camphor entirely, and leave the gum copal pure, and colourless, upon the work.

VARNISH, among medalists, signifies the colours antique medals have acquired in the earth.

The beauty which nature alone is able to give to medals, and art has never attained to counterfeit, enhances the value of them; that is, the colours, with which certain soils in which they have a long time lain, tinge the metals; some of which are blue, almost as beautiful as the turquoise; others with an inimitable vermilion colour; others with a certain shining polished brown, vastly finer than Brazil figures.

The most usual varnish is a beautiful green, which hangs to the finest strokes without effacing them, more accurately than the finest enamel does on metals. No metal but brass is susceptible of this; for the green rust that gathers on silver always spoils it, and it must be got off with vinegar or lemon juice.

Falsifiers of medals have a false or modern varnish, which they use on their counterfeits, to give them the appearance of being antique. But this may be discovered by its softness, it being softer than the natural varnish, which is as hard as the metal itself. Some deposit their spurious metals in the earth

for a considerable time, by which means they contract a sort of varnish, which may impose upon the less knowing; others use sal ammoniac, muriat of ammonia, and others burnt paper, &c.

Gilt varnish is made of linseed oil, sandarach, aloes, gamboge, and litharge of gold.

China varnish is made of gum-lac, colophony, mastich, and spirit of wine.

A varnish for brass, to resemble gold. Take two quarts of spirits of wine, and put it into a glass bolt-head; add to it one ounce of gamboge, two ounces of lac, and two ounces of gum mastich; set this in a sand-heat for six days, or else near a fire, or you may put the body of the bolt-head frequently into warm water, shaking it two or three times a day; then set it over a pan of warm small coal dust. Before you lay this varnish over the metal, take care that it has been well cleaned, varnish it over thinly with this varnish, and it will appear of a perfect gold colour. Set it in a declining oven to harden, and it will not rub off.

VAT, *see* FAT.

VEER, a sea-term variously used. Thus, veering out a rope, denotes the letting it go by the hand, or letting it run of itself. It is not used for letting out any running rope except the sheet. Veer is also used in reference to the wind, for when it changes often they say it veers about.

VEIN, among miners, is that space which is bounded with woughs, and contains ore, spar, canck, clay, chirt, croil, brown-hen, pitcher-chirt, cur, which the old mineralogists and alchemists denominated the mother of metals, and sometimes soil of all colours. When it bears ore it is called a quick vein; when no ore it is called a dead vein.

VELLUM, (GER. *Velin*. *Feines pergament*. DU. *Velin*. DA. *Kalvskinds pergament*. VELIN. SW. *Velin*, *Kalvskins, pergament*. FR. *Velin*. IT. *Pergamenta fina*. SP. *Pergamino fino Vitela*. PORT. *Pergaminho fino de vitella*.) a kind of fine parchment. It is made of calf-skin extended and drawn to a proper thinness when green; and parchment is made of sheep-skins in like manner. *See* PARCHMENT.

VELVET, (GER. *Sammet*. DU. *Fluweel*. DA. *Fløjel*. SW. *Sammet* FR. *Velours*. IT. *Velluto*. SP. *Terciopelo*. PORT. *Velludo*. RUS. *Barchat*. POL. *Aksamit*.) a rich kind of stuff, all silk, covered on the outside with a close, short, fine, soft shag, the other side being a very strong close tissue. The nap or shag, called also the velveting, of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channelled ruler or needle, which he afterwards cuts, by drawing a sharp steel tool along the channel of the needle to the ends of the warp.

There are various kinds of velvets; *Plain*,

that is, uniform and smooth, without either figures, or stripes.

Figured velvet, that is, adorned and worked with divers figures, though the ground is the same with the figures, that is, the whole surface velveted.

Ramaged or branched velvet, representing long stalks, branches, &c. on a satin ground, which is sometimes of the same colour with the velvet, but more commonly of a different one. Sometimes, instead of satin, they make the ground of gold and silver.

Shorn velvet, is that, wherein the threads, that make the velveting, have been ranged in the channelled ruler, but not cut there. Striped velvet is that, wherein there are stripes of different colours running along the warp, whether these stripes are partly velvet, or all velveted.

Cut velvet is that, whereon the ground is a kind of taffety, or *gros de tours*, and the figures velvet.

Velvets are likewise distinguished, with regard to their different degrees of strength and goodness, into velvets of four, three, and two, threads, and a thread and a half. The first of those, where there are eight threads of shag, or velveting, to each tooth of the reed; and the second has only six, and the rest four. All velvets, both worked and cut, shorn and flowered, are to have their warp and shag of organzine, spun and twisted, or thrown in the mill; and their woof of silk well boiled, &c. Florence, Genoa, and some other cities of Italy, are most noted for the manufacture of velvet. There are cotton velvets manufactured in imitation of the silk ones, principally at Manchester and Bolton.

VELVERET, (GER. *Manchester*. DU. DA. and SW. *Manchester*. FR. *Velours de coton*. IT. *Velluto di cotone*. SP. *Terciopelo de algodón*. PORT. *Velludo de algodão*.) a species of cotton velvet, chiefly manufactured at Manchester, and in its neighbourhood. *See* VELVET.

VENDOR and VENDEE. The vendor is the person who sells, and the vendee the person who buys.

VENEERING, VANEERING, or FRNEERING, a kind of marquetry or inlaying, whereby several thin slices or leaves of fine woods of different kinds, are applied and fastened on a ground of some common wood. There are two kinds of inlaying; the one which is the most common and more ordinary, goes no farther than the making of compartments of different woods; the other requires much more art, in representing flowers, birds, and similar figures.

The first kind is properly called veneering; the latter is more properly called marquetry. *See* MARQUETRY.

The wood used in veneering is first sawed out into slices or leaves, about a line in thickness; i. e. the twelfth part of an inch.

In order to saw them, the blocks or planks are placed upright, in a kind of sawing-press. These slices are afterwards cut into narrow slips, and fashioned divers ways, according to the design proposed; then the joints having been exactly and nicely adjusted, and the pieces brought down to their proper thickness, with several planes for the purpose, they are glued down on a ground or block, with good strong English glue.

The pieces being thus jointed and glued, the work, if small, is put in a press; if large, it is laid on a bench covered with a board, and pressed down with poles or pieces of wood, one end of which reaches to the ceiling of the room, and the other bears on the board.

When the glue is dry, it is taken out of the press, and finished; first with little planes, then with scrapers, some of which resemble rasps, which take off the dents, &c. left by the planes.

After it has been sufficiently scraped, they polish it with the skin of a dog-fish, wax and a brush, or polisher of shave-grass; which is the last operation.

VERDEGRIS, or **VERDEGREASE**, (GER. *Grünspan*. DU. *Spaansch groen*. DA. *Spansk grønt*. SW. *Spank gröna*. FR. *Verde-gris*, *Verdet*. IT. *Verderame*. SP. *Cardenillo*, *Verdete*, *Verde-gris*. PORT. *Verdete*, *Verdegri*, *Cardinillo*. RUS. *Jar*. POL. *Gryszpan*. LAT. *Ærugo*, *Viride æris*.) is an acetat of copper, useful in the arts as a pigment. The principles on which it is formed are these:

Acetic acid attacks copper very slowly in open vessels, converts it into an oxide, and dissolves it; but in close vessels no action takes place. This acid readily combines with the oxide of copper, and forms with it an acetat. This salt was known by the ancients; and various ways of preparing it are described by Pliny. It is usually obtained by exposing plates of copper to the action of vinegar, till they are converted to a blueish green powder, and then dissolving this powder in acetite acid, and crystallising it.

Acetat of copper crystallises in four-sided truncated pyramids. It has a beautiful blueish green colour. Its specific gravity is 1.779: its taste is disagreeably metallic, and, like all the compounds into which copper enters, it is poisonous. It is very soluble in water; alcohol likewise dissolves it. When exposed to the air, it effloresces. By distillation it gives out acetic acid. It is much used as a paint; and crystallised acetat of copper is a frequent ingredient in dyeing compounds. Verdegris is formed in great quantities at Montpellier. A particular account of the process followed in that place has been published by M. Chaptal. And a Mr. Jacob Zink obtained, in 1812, a patent for the manufacture of this article. The

materials of which it is to be made consist of pure copper, acid, and alkali. Of these are made, 1st, a saturated solution of oxyde of sulphate of copper; 2dly, a solution of either vegetable or mineral alkali; which two, when properly mixed and combined, will produce the superior verdegris for which a patent is claimed. The solution of oxyde of sulphate of copper, is made in a copper vessel, capable of containing eight hundred gallons; which vessel is to be placed in a still larger one of iron, standing over a furnace, and the vacant space between the two is to be filled with sand. Twelve pounds of pure copper, cut small or granulated, are to be put into the copper with thirty pounds of sulphuric acid, and a fire to be lighted in the furnace; when the materials are hot, about eight pounds of water are to be added, and the whole to be boiled together till the calcination is effected. This prepared oxyde is to be removed, and another portion to be manufactured; and then continued till there be enough to saturate eight hundred gallons of water, in which it is to be dissolved: in this way, the first solution is prepared. The other is simply that of one hundred and fifty pounds of alkali being dissolved in about three hundred gallons of water: by the mixture of these two articles, in proper proportions, the requisite substance is obtained. Still, however, it requires to be freed first from the water it contains: it is then to be cleaned and purified, and last of all to be made perfectly dry: the method of performing this is described in the specification to which the reader is referred.

VERDITER, or **VERDETER**, (GER. *Bergblau*, *Kupferblau*. DU. *Bergblaau*. DA. *Biergblaat*. SW. *Bergblätt*. FR. *Cendres bleues*. IT. *Azzurro di montagna*. SP. *Verde-Tierra*. PORT. *Verdemontanha azul*. RUS. *Golubez*, *Medndia lazur*. LAT. *Ceruleum montanum*.) a kind of mineral substance, used by painters, &c for a blue; but more usually mixed with a yellow for a green colour. Verditer, according to M. Savary, ought to be made of the *lapis armenus*; or at least of an earthy substance much like it, brought from the mountains of Hungary, &c. only prepared by powdering it, and cleansing it by lotion.

The method of making verditer with us is as follows; into 100 lbs. of whiting, the refiners pour the copper-water, and stir them together every day for some hours, till the water grows pale; then they pour that away, set it by for other use, and pour on more of the green water, and so till the verditer be made; which being taken out, is laid on large pieces of chalk in the sun, till it be dry and fit for market.

VERJUICE, (GER. *Agrest*. DU. *Verjus*. DA. and SW. *Agrest*. FR. *Verjus*. IT. *Agresto*. SP. *Agraz*. PORT. *Agrazo*. LAT. *Agresta Omphacium*.) a liquor obtained from grapes or apples, unfit for wine or cyder; or

from sweet ones, whilst yet acid, and unripe. Its chief use is in sauces, ragouts, &c. though it is also an ingredient in some medicinal compositions, and is used by the wax-chandlers to purify their wax. It takes its name from a large sort of grape, called *verjus*, or *bourdelos*. Verjuice, and vinegar, are subject to the laws of excise, and were newly regulated by 58 Geo. 3. c. 65.

VERMICELLI, (GER. *Nudeln*. DU. *Meelneepen*, *Proppen*. DA. and SW. *Nudler*, *Vermicelli*. FR. *Vermicelli*. IT. *Vermicelli*, *Tagliolini*. SP. *Aletrias*. PORT. *Aletrias*, *Fideos*. RUS. *Lapscha*.) an Italian mixture, prepared of flour, cheese, yolks of eggs, sugar, and saffron; and reduced into little long pieces, or threads like worms, by forcing it with a piston through a number of little holes in the end of a pipe made for that purpose. It is much used in Italy, and other countries, in soups, broths, &c. Allowed to be imported from our American colonies, free of duty, by 7 Geo. 3.

VERMILION, (GER. *Vermiljon*. DU. *Vermiljoen*. DA. *Vermillion*. SW. and FR. *Vermillon*. IT. *Vermiglione*. SP. *Vermillon*. PORT. *Vermelhão*.) a very bright and beautiful, red colour, in great esteem among the ancients, under the name of *minium*. There are two kinds of it, the one natural, the other factitious. The natural is found in some silver mines, in the form of a ruddy sand, which is afterwards prepared and purified by several lotions, &c. The artificial is made of mineral cinnabar, ground, and mixed with aqua-vitæ and urine, and afterwards dried. It is of great use with miniature and oil painters. See CINNABAR.

VICE, (GER. *Schraubstock*. DU. *Schroes-tok*. DA. *Skruvstikke*. SW. *Skrufstäd*. FR. *Etau*. IT. *Morsa*. POL. *Szrubstak*.) in smithery, and other arts employed in metals, is a machine, or instrument, serving to hold fast any thing for working upon, whether it is to be filed, bent, riveted, &c. To file square, it is absolutely necessary that the vice should be placed perpendicular, with its chaps parallel to the work-bench.

VICE, Hand, a small kind of vice serving to hold the lesser works in, that require often turning about. Of these there are two kinds: the broad-chapped hand-vice, which is that commonly used; and the square-nosed hand-vice, used for filing small round work.

VICE is also a machine used by the glaziers to draw lead into flat rods, with grooves on each side to receive the edges of the glass.

VIDONIA, a white-wine, the produce of the island of Teneriffe, very much resembling Madeira, but of a tart flavour, and a quality inferior to the last-mentioned wine. See WINE.

VINE, *Vitis*, a noble plant, or shrub, of the creeping kind, famous for its fruit, or grapes, and for the liquor they afford. See WINE.

VINEGAR. (GER. *Essig*. DU. *Azyn*. DA. *Æddike*. SW. *Attika*. FR. *Vinaigre*. IT. *Aceto*. SP. and PORT. *Vinagre*. RUS. *Uknaus*. POL. *Ocet*. LAT. *Acetum*.) the product of that species of fermentation of vegetable matter, termed the *acetous fermentation*, is a peculiar acid (see ACID, *acetic*.) which, in combination with the various substances contained in the liquor from which it is produced, constitutes what is commonly termed vinegar.

It may be obtained by fermentation from all substances which contain saccharine matter. The best is procured from wine; and large quantities are annually made in the wine counties of France. The circumstances, in which acetous fermentation takes place, are, a temperature between 70 and 80 degrees, the addition of some fermenting substance, and exposure to the air.—The practice recommended by Boerhaave, is generally followed: Two large hogsheds are prepared, by fixing about a foot from the bottom, a grating of rods, on which vine branches are to be placed. The wine to be fermented is poured into the vessels; the one is to be filled to the top, and the other only one-half. Fermentation begins in the vessel which is half full; when it is completely begun, fill it up from the other vessel, the fermentation is interrupted in the filled vessel, and it commences in the one which is not full. When this has continued for a little time, it is filled up from the other vessel, in which the fermentation again commences, and is interrupted in the other. Thus the process is carried on, by alternately emptying, and filling, the vessels, till vinegar is formed, which generally requires a period of from 12, to 15, days. Vinegar is generally of a yellowish colour, an acid taste, and an agreeable smell. The specific gravity varies from 1.005 to 1.0251. It varies considerably in colour, specific gravity, and other properties, according to the substances from which it has been obtained.

Vinegar of four Thieves, a composition so called, because, during a plague at Marseilles, four persons attended the sick for the purpose of robbery, without being affected with the disease, which they attributed to the use of this composition.—The following is the receipt given for the preparation of it, by one of them, who saved himself from the gallows by making it known: Take of lavender, rosemary, rue, sage, and mint, of each a handful, white-wine vinegar, one gallon, digest in a water-bath for eight days.

The 58 Geo. 3. c. 65. recites, that the duties imposed on vinegar had been much evaded, and that large quantities had been sent out, without the officers of excise having any account thereof; and also, that vinegar, or acetous acid, made under the denomination of *pyrolygneous acid*, has been lately brought into consumption, of great strength, without payment of duties. It then pro-

ceeds to enact, that the old duties shall cease, and that instead thereof, certain new duties shall be paid, as well for every gallon of acetic acid, or vinegar, prepared, or preparing for sale, in Great Britain, or imported from Ireland, as from foreign countries, respectively. That the duties shall be levied as former duties, and drawbacks allowed in like manner. s. 1, 2, 3. (*see App.*) Liquors of all kinds made into vinegar, or acetic acid, to be subject to the duties, and the persons preparing them to be deemed vinegar-makers: but not to extend to pyroligneous acid, extracted from wood, or tar, for sale, in its crude, impure, and unrectified state; or any white-lead, sugar of lead, verdigris, iron liquor, acetate of lime, soda, or alumine, or any acetic acid made, purified, &c. for the sole purpose of compounding such articles. s. 6.

Vinegar for sale made from malt, and pyroligneous acids, shall be made in distinct places, no less than 300 feet asunder, under a penalty of 500*l*.

On all questions that may arise, "whether vinegar, or acetic acid," proof to be on the owner. s. 27.

The statute contains various other provisions necessary for accomplishing the object for which it was passed, irrelevant to the purposes of general information, and too technical to be epitomized with safety to those whose callings subject them to its penalties.

VIOLIN. *See FIDDLE.*

VITRIOL. (*GER. Vitriol. Du. Vitriool. DA. Sw. and Fr. Vitriol. IT. Vitriuolo. SP. and PORT. Vitriolo. RUS. Kuparos. POL. Koperwas. LAT. Vitriolum.*) Sulphat of iron, formerly called *green vitriol*, has a fine green colour. Its crystals are transparent rhomboidal prisms, the faces of which are rhombs with angles of $79^{\circ} 50'$ and $100^{\circ} 10'$, inclined to each other at angles of $98^{\circ} 37'$ and $81^{\circ} 23'$. It has a very strong styptic taste, and always reddens vegetable blues. Its specific gravity is 1.8599. It is soluble in about two parts of cold water, and in $\frac{3}{4}$ ths of its weight of boiling water. It is insoluble in alcohol.

The *blue*, or *sulphat of copper*. Sulphuric acid does not attack copper while cold, but at a boiling heat part of the acid is decomposed, the copper is oxidized, and combines with the remainder of the acid. But recourse is seldom had to this process, as the sulphat of copper is found native abundantly, dissolved in mineral waters connected with copper mines. From these waters it is often obtained by evaporation, or it is formed by burning native sulphuret of copper, or by moistening that substance, and exposing it to the air. By either of these methods, the sulphur is acidified, and the sulphat of copper formed. This salt appears to have been known to the ancients. In commerce it is distinguished by the name of *blue vitriol*, and sometimes by that of *blue copperas*, and among the dyers by simply that of *bluestone*.

The *white*, or *sulphat of zinc*. This salt was discovered at Rammelsberg in Germany, about the middle of the 16th century. It is usually formed for commercial purposes from sulphurated zinc, or blende, as it is called by mineralogists.

This ore is roasted, which converts the sulphur into an acid; it is then dissolved in water, and concentrated so much, that, on cooling, it crystallises very rapidly, and forms a mass not unlike loaf-sugar. This salt is usually called *white vitriol*. It is almost always contaminated with iron, and often with copper and lead. Hence the yellow spots which are visible on it, and hence also the reason that its solution in water lets fall a dirty-brown sediment. It may be easily purified by dissolving it in water, and putting into the solution a quantity of zinc-filings; taking care to agitate it occasionally. The zinc precipitates foreign metals, and takes their place. The solution is then to be filtered, and the sulphat of zinc may be obtained from it in crystals, by proper evaporation.

VITRIOL, Oil of. *See ACID, Sulphuric ULLAGE*, signifies so much of a cask, or other vessel, as it wants of being full.

ULTRAMARINE. (*GER. Ultramarin. Du. Ultramarijn. DA. and Sw. Ultramarin. FR. D'outremer, Bleu d'outremer. IT. Oltrammarino. SP. Ultramar. PORT. Azzul d'ultramarinho. RUS. Ultramarin. POL. Ultramaryna. LAT. Ultramarinum.*) a very fine blue powder made from the blue parts of lapis lazuli. It has the uncommon property of neither fading, nor becoming tarnished, on exposure to the air, or a moderate heat, and on this account is much used in painting. *See AZURE.*

UMBER, or UMBRE. (*GER. DU. DA. and Sw. Umbra. FR. Ombre. IT. Umbria, Terra d'ombre. SP. and PORT. Sombra. RUS. POL. and LAT. Umbra.*) among painters, &c. a kind of dry dusky-coloured earth, which, diluted with water, serves to make a dark-brown colour.

UMPIRE, and UMPIRAGE. When two arbitrators cannot agree, it is customary to appeal to some third person to decide between them; in which case such person is denominated the *umpire*, and his decision is called the *umpirage*. *See title AWARD.*

UNDERWRITER is an insurer who *underwrites*, or subscribes his name to, policies of insurance on ships, merchandise, &c. for a certain sum, for which he receives a premium, and consequently takes the risk on himself, so far as the sum he insures. By 1 & 2 Geo. 4. c. 75. certain acts are continued and amended for preventing frauds, &c. on underwriters and others, and certain defects in the adjustment of salvage, under 12 Anne, are remedied. *See INSURANCE.*

URANIUM, is the name of a metal, discovered by Klaproth in the year 1786, in a mineral called *uranite*, which is found in

Bohemia, and in some parts of this country. Uranium, in colour, somewhat resembles iron, but of considerable lustre; it is hard and brittle; fuses with great difficulty, and does not tarnish by exposure to the atmosphere at its usual temperature. It is capable of forming a black and yellow oxide; the latter imparts to porcelain a permanent deep orange-yellow colour. Klaproth by different proportions of its oxides, gave the following bright colours to glass: brown, apple-green, and emerald-green. By dissolving the yellow oxide in nitric acid, he procured beautiful transparent green crystals. When dissolved in acetic acid it produced topaz-yellow crystals. These properties will render it highly useful in painting, and the manufacturing of glass and porcelain.

USANCE is the time of *one, two, or three* months after the date of a bill of exchange, according to the custom of the places between which the exchange runs. Double, or treble, usance, is double, or treble, the usual time, and half usance is half the time. Where it is necessary to divide a month, the half usance, notwithstanding the difference in the length of the month, contains fifteen days. *Mar. 95.* The usances are calculated exclusive of the date of the bill. Bills of exchange drawn at usance are allowed the usual days of grace, and on the last of the three days the bill should be presented for payment. *See BILLS OF EXCHANGE.*

USQUEBAUGH, a strong compound liquor, chiefly taken by way of dram: it is made in the highest perfection at Drogheda in Ireland. The following are the ingredients, and the proportions in which they are to be used:—Best brandy one gallon; raisins stoned, one pound; cinnamon, cloves, nutmeg, and cardamoms, each one ounce, crushed in a mortar; saffron half an ounce; rind of one Seville orange; one pound of brown sugar-candy. Shake these well every day for at least fourteen, and it will, at the expiration of that time, be ready to be fined for use. There is a *green usquebaugh*, manufactured by substituting stalks of angelica for the saffron; white for brown sugar-candy; and the brandy in its original uncoloured state for that which is in common use. The green, however, is not so rich in flavour, and is considered inferior, as a stomachic, to the yellow usquebaugh.

USURY, consists in taking more than five per cent. for the loan of money, when the obligation to repay is absolute; but where there is any risk there is no fixed rate of interest, and therefore there can be no action for usury.

By the 12 Anne. st. 2. c. 16. No person upon any contract shall take for the loan of any money, wares, &c. above the value of 5*l.* for the forbearance of 100*l.* for a year; and all bonds and assurances for payment of any money to be lent upon usury, whereupon or whereby there shall be reserved or

taken above five pounds in the hundred, shall be void; and every person who shall receive by means of any corrupt bargain, loan, exchange, chevance, shift, or interest of any wares or other things, or by any deceitful way, for forbearing or giving, day of payment for one year, for their money or other things, above 5*l.* for 100*l.* for a year, &c. shall forfeit treble the value of the money or other things lent.

To the restrictions contained in this act there are only two exceptions: first, in the case of money lent upon the security of lands in Ireland, or the Plantations, where interest after the rate of 6 per cent. per ann. is allowed by the 14 Geo. 3. c. 79.

Secondly in the case of annuities for lives granted on personal security, where the contingency of the borrower's death makes an additional compensation requisite. These were first regulated by 17 Geo. 3. c. 26., but are regulated anew by 53 Geo. 3. c. 141.

So that if there be an agreement to pay legal interest, and a premium be paid down for the loan over and above the interest, such agreement is usurious and void.

But the penalty is not incurred if the premium itself do not exceed legal interest, nor till more than legal interest has been actually received. Wherefore it is the usual practice for bankers, and others, when they discount a bill, to retain the discount, or premium, for discounting at the rate of five per cent. per ann. for such interest may be as lawfully received before hand for forbearing, as afterwards for having forborne. *Doug. R. 235.*

It has been said, however, that this practice is only applicable to bills, notes, and other negotiable instruments, but not to bonds. But *Quære de hoc. Chitty, 54.*

If a bill of exchange or note be given in consequence of an usurious contract, it is absolutely void, even in the hands of an innocent person who might have taken it in the regular course of business, without notice of usury. *Doug. R. 728.* But this is altered by 58 Geo. 3. c. 95.

So in case of gaming debts. Every bill or promissory note, where the consideration, or any part, is money lent for gaming, or upon an usurious contract, is void in the hands of an indorsee, even for a valuable consideration and without notice. 1 *T. R. 153.*

But it is not any defence that the bill was accepted for a gaming debt, if it be indorsed over for a valuable consideration to an innocent third person, by whom the action is brought. *Edwards v. Dick, 4 B. & A. 212.*

And any contract reserving a greater advantage to the lender than legal interest, however, disguised; as if part be under the appellation of interest, and the remainder in the rent of a house, or other thing clearly and plainly exceeding the legal compensation. But if one lend another a sum conditioned to receive double on non-payment of the

principal at a certain day, this is not usury; because the borrower may discharge himself by paying the principal.

Neither, where *the whole* depends upon a contingency, is the contract usurious; but if the principal be secured, and the interest *only* be hazarded, it may be usurious. *Cro. J.* 580.

It is lawful for a country banker, in discounting bills, to take over and above the five per cent. interest or discount, a sum under the name of commission for his trouble. *Winch v. Fenn.* 2 T. R. 52.

But a London banker cannot legally take any thing above discount, under any appellation, or pretence, whatsoever.

Nor will any shift or contrivance to give

a London transaction the appearance of a country one answer the purpose.

And the sum taken for commission by a country banker, must be a reasonable one, according to the general usage, but no other advantage; as for instance, instead of giving cash for bills, after deducting discount at 5 per cent. and reasonable commission, he must not give other bills at two, or three, days' sight, for the additional time gained is worth so much money, and makes the contract usurious, and not only the consent, but even the request of the person paying the discount, will not get rid of the usury. *Parv. Eliason* 1 E. R. 92.

W A G

W, The twenty-first letter of our alphabet.

WAD, or **WADDING**, in gunnery, a stopple of paper, hay, straw, old rope-yarn, or tow, rolled firmly up like a ball, or a short cylinder, and forced into a gun upon the powder to keep it close in the chamber; or put up close to the shot to keep it from rolling out, as well as, according to some, to prevent the inflamed powder from dilating round the sides of the ball, by its windage, as it passes along the chase, which it was thought would much diminish the effort of the powder. But from accurate experiments made at Woolwich, it has not been found to have any such effect.

WAFERS (GER. *Oblaten*. DU. *Ouwels*, Obli. DA. *Oblater*. SW. *Oblater*, *Munlák*. FR. *Oublies*. IT. *Ostie*, *Bollini*. SP. *Obleas*. PORT. *Obreas*. RUS. *Oblatü*. POL. *Oplatki*. LAT. *Nubeculi*.) for sealing letters, &c. are made thus: Take very fine flour, mix it with white of eggs, isinglass, and a little yeast; mingle the materials; beat them well together; spread them, the batter being made thin with gum-water, on even tin plates, and dry them in a stove, then cut them out for use. To colour them, tinge the paste with brazil or vermilion for red; indigo or verditer, &c. for blue; saffron, turmeric, or gamboge, &c. for yellow.

WAGES, the recompense paid to servants and labourers for work. By statutes passed in the reigns of Queen Elizabeth, and King James I., justices were authorised to fix the rates of wages in their respective districts; but by 53 Geo. 3. c. 40., these statutes are repealed, and personal labour, like most other commodities, by the liberality and wisdom of modern times, is left to find its own level at the best market. Hence wages differ greatly in different situations,

W A K

as well as in different occupations. It is sufficient in this place to notice, that beside the general laws for the regulation of masters and servants, and the interpretation of the contracts between them (for which see title MASTER and SERVANT), there is scarcely a manufacture executed in the kingdom, to the wages earned in which there is not a correspondent statute applicable, especially the following. In the

Silk trade—15 Geo. 3. c. 68.—52 Geo. 3. c. 44.—51 Geo. 3. c. 7.

Cloth trade—10 Ann. c. 16.—1 Geo. 1. c. 15.—29 Geo. 2. c. 33.

Cotton and linen trade.—1 Ann. c. 18.—15 Geo. 3. c. 23.—44 Geo. 5. c. 87.

Leather trade—13 Geo. 2. c. 8.—22 Geo. 2. c. 27.

Hat, and fur trade—22 Geo. 2. c. 27.—13 Geo. 3. c. 23.

Lace trade—19 Geo. 3. c. 49.

Clock and watch trade—27 Geo. 2. c. 7.

Paper trade—56 Geo. 3. c. 111.

Iron, steel, and cutlery trade—57 Geo. 3. c. 115.

Coal trade—57 Geo. 3. c. 122.

Beside these which specifically apply to the respective occupations enumerated, 39 & 40 Geo. 3. c. 106., relates to wages in all trades whatever; and see 1 Geo. 4. c. 93.

WAKE, of a Ship, is the smooth water a-stern when she is under sail. This shows the way she has gone in the sea, whereby the mariners judge what way she makes. For if the way be right astern, they conclude she makes her way forwards; but if the wake be to leeward a point or two, then they conclude she falls to the leeward of her course. When one ship, giving chase to another, is got as far into the wind as that other, and sails directly after her, they say she has got into

her wake. A ship is said to stay to the weather of her wake, when, in her staying, she is so quick, that she does not fall to leeward upon a tack, but that, when she is tacked, her wake is to the leeward, and it is a sign she feels her helm very well, and is quick of steerage.

WALE, or WALES, in a ship, those outermost timbers in a ship's side on which the sailors set their feet in climbing up. They are reckoned from the water, and are called her first, second, and third wale, or bend.

WALES, *New South*. See HOLLAND, *New*.

WALNUT TREE. A well known tree, bearing a nut which is used for various culinary, and other purposes. When green, and just previous to the shell beginning to harden, it forms a delightful pickle, immersed in vinegar. Boiled in sugar, at the same period, it is a mild cathartic of certain operation, and well adapted to children. Ripe, and deprived of the thick spongy coat in which it is enveloped, it is an agreeable article in a dessert: and this very spongy coat, or husk, is not valueless, for it makes catsup or ketchup equally good with that extracted (as is the usual practice) from the whole young nuts in their green state. The wood of this tree was much used before the introduction of mahogany, in making furniture; but its aptness to be worm-eaten

has occasioned its being in a great measure superseded. It still, however, is preferred to every other wood for the stocks of firelocks of every description. It is much to be lamented that the length of time before a walnut tree begins to bear fruit (about 20 years) operates as such a discouragement to the planting of them, that their numbers are much upon the decline.

WAREHOUSE. A receptacle for wares and merchandise.

WAREHOUSING SYSTEM. Formerly, when goods were imported, the amount of the duties of customs and excise was required to be immediately paid. By a succession of statutes, viz. 43 Geo. 3. c. 132. — 45 Geo. 3. c. 87. — 46 Geo. 3. c. 137. — 49 Geo. 3. c. 106. — 50 Geo. 3. c. 64. — 52 Geo. 3. c. 142. & 57 Geo. 3. c. 116. the system which this article embraces, and by which permission is given to importers (on certain conditions) to postpone the periods for payment of these duties, on the placing their respective commodities in warehouses furnished by the government for that purpose, was commenced and matured. This system cannot be compressed within our limits; but the following catalogues will exhibit all the information desirable in an elementary work. The laws relating to warehoused goods are amended by a late stat. 1 & 2 Geo. 4. c. 105.; and See title EXCISE.

A LIST of the WAREHOUSING and BONDING PORTS in ENGLAND and SCOTLAND, distinguishing the several Species of Goods allowed to be Warehoused or Bonded at each Port.

TABLES of ARTICLES that may be Warehoused or Bonded in Great Britain before Payment of Duty, by 43 Geo. 3. c. 132; 45 Geo. 3. c. 87; 50 Geo. 3. c. 64; and 52 Geo. 5. c. 142.

TABLE A.

Articles not imported by the East India Company.

Cocoa Nuts	Coffee	Sugar
Cortex Angusturæ	Cassia Fistula	Roco or Annatto.

Articles imported from the West Indies.

Cotton Wool	Mahogany	Rum
Ginger	Melasses	Wine
Indigo	Pimento	

Prize Goods enumerated in this Table.

TABLE B.

Articles not imported by the East India Company or from the West Indies.

Rice	Brandy	Prize Goods enumerated in
Tobacco	Geneva and other Spi s	this Table.
Wine		

TABLE C.

Articles not imported by the East India Company or from the West Indies.

Brimstone	Kelp	Staves
Cork	Linseed	Tallow
Hemp undressed	Mahogany	Tar
Iron slit or hammered into rods, and iron drawn or hammered under three fourths of an inch square	Marble Blocks	Timber
Iron in bars	Pitch	Tow
	Rape Seed	Turpentine
	Rosin	Wood.

TABLE D.

Articles not imported by the East India Company or from the West Indies.

Hides.

Skins and Furs, viz. Indian Deer Skins, half dressed or shaved.

Other Skins and Furs not tanned, tawed, or in any way dressed.

Spermaceti Oil, Head Matter, Train Oil, and all other Fish Oil, Blubber, and Whale
Fins of British fishing.

TABLE E.

Articles not imported by the East India Company or from the West Indies.

Alkermes	Hams	Oil, Palm
Almonds, of all sorts	Harp Strings	— Perfumed Oil not other- wise enumerated
Amber Beads	Hones	— of Pine
Anchovies	India Rubbers	— Rock Oil
Anniseed	Indigo	— of Rosemary
Arrow Root	Isinglass	— of Rosewood
Ashes	Jalap	— Salad
Balsam, of all sorts	Jesuits' Bark	— of Sassafras
Barilla	Jet	— of Spike
Bees' Wax	Juniper Berries	— of Thyme
Bristles undressed	Juice of Lemons, Limes, or Oranges	— of Turpentine
Cantharides	Lamp Black	— Walnut Oil
Carpets, Turkey	Linen, plain, of all sorts, except Sail-cloth	Opium
Catlings, or Lutestrings	Linseed Cakes	Orange Flower Ointment
Chip Hats	Liquorice Powder	Water
Citrate of Lime	Manna	Pearl Barley
Clover Seed	Melasses	Pictures
Cochineal	Mercury	Pitch, Burgundy
— Dust	Mohair Yarn	Pots, Melting
Coral Beads	Oil of Almonds	Prunes
Cotton Wool	— of Amber	Quicksilver
— Yarn	— of Anniseed	Radix Serpentina, or Snake Root
Currants	— of Bay	Rags
Elephants' Teeth	— of Cajaputa	Raisins, of all sorts
Essence of Bergamot	— of Carraway	Rape Cakes
— of Lemon	— of Cassia	Rhinehurst
— of Spruce	— of Castor	Rhubarb
..... of the produce of, and imported from, any British colony, &c. in America	— Chemical Oil, not other- wise enumerated	Saccharum Saturni
Euphorbium	— of Cinnamon	Saffron
Feathers for Beds	— of Cloves	Sal Ammoniacus
Figs	— of Jessamine	— Gem
Flax	— of Juniper	— Limonum, or Acetosella
Ginseng	— of Lavender	— Prunelle
Granilla	— of Linseed	— Succini
Gum Arabic	— of Mace	Saphora
— Copal	— of Marjoram	Sarsaparilla
— Guaiacum	— of Nutmegs	Sena
— Senega	— of Olives	Silk, Raw.
	— of Oranges	— Thrown
		— Waste

W A R

TABLE E. — *continued, viz.*

Smalts	Tapioca	Verdigris
Straw Hats	Tar, Barbadoes	Vermilion
Succus Liquoritia, or Lique- rice Juice	Tornsal	Zaffar and Cobalt.
	Toys	

And also all Goods unmanufactured, except goods imported from any place within the limits of the charter granted to the East India Company.

A LIST, showing at one View every Article that may be Warehoused or Bonded in Great Britain before payment of Duty, distinguishing in which of the preceding Tables the same is classed. (a)

And also all Goods unmanufactured, *whether from the West Indies, or not, except goods imported from any place within the limits of the charter granted to the East-India Company.....E*

By Order of the Board of Customs, dated November 12. 1805, the following articles being deemed peculiarly liable to the danger of *fire*, it is directed, that officers at the out-ports are, in all cases, to prevent as much as possible the intermixture of them with the other goods in *Tables A. B. C. and D. viz.*

In TABLE C.		In TABLE D.
Brimstone	Rosin	Head Matter
Hemp undressed	Tow	Train Oil
Pitch	Turpentine.	Spermaceti Oil, and all other
Tar		Fish Oil.

WARP, in the manufactures, is the threads, whether of silk, wool, linen, hemp, &c. that are extended lengthwise on the weaver's loom, and across which the workman, by means of his shuttle, passes the threads of the woof, to form a cloth, ribband, fustian, or other stuff. For a woollen stuff to have the necessary qualities, it is required that the threads of the warp should be of the same kind of wool, and of the same firmness throughout; that they be sized with Flanders or parchment-size, well prepared; and that they should be in sufficient number, with regard to the breadth of the stuff to be wrought.

WARRANT OF ATTORNEY, is a security given by a defendant to the plaintiff, upon compromising any action: and it derives its name from giving authority to the attorney or attorneys to whom it is directed, to appear for the defendant, and receive a declaration in an action to be brought against him, and thereupon to confess the said action, or suffer judgment to pass by default.

Every warrant of attorney should be given voluntarily, and for a good consideration; for if it be obtained by fraud, or founded upon a corrupt, or usurious, consideration, the court will set aside the judgment, if entered up, together with all the proceedings under it, and order it to be delivered up. A warrant of attorney need not be by deed, nor does it require an attesting witness. *Kinnersly v. Massen*, 5 Taunt. 264.

No warrant of attorney executed by any person in custody of the sheriff, shall be valid, or of any force, unless there be present some attorney on the behalf of the person in custody, to be expressly named by him, and attending at his request, to inform him of the nature and effect of such warrant of attorney before the same is executed, which attorney shall subscribe his name as a witness to the due execution thereof. *Hutson v. Hutson*, 9 T. R. 7.

Where a warrant of attorney is given by a defendant in custody, upon process of execution, or upon criminal process, or to a third person, at whose suit the defendant is not in custody, the presence of an attorney is unnecessary. *Charlton v. Fletcher*, 4 T. R. 433.

A warrant of attorney given to confess a judgment is not revocable; and if the party giving such warrant of attorney endeavour to revoke it, the court will, notwithstanding, give the other party leave to enter up the judgment.

The death of either party is a countermand of the warrant of attorney; but if either party die in vacation, within a year after giving the warrant of attorney, judgment may be entered up in course at any time after in that vacation, and it will be a good judgment at common law.

Where there are several parties, and one of them dies before judgment, it may be

entered up either by, or against, the survivors.

Where a warrant of attorney is given to a single woman, who afterwards marries, judgment may be entered upon the names of the husband and wife.

If a warrant of attorney be given to confess a judgment of a particular term, the judgment should be entered as of that term; but if it be given generally, or of a particular, or any subsequent term, (which is the most usual form,) judgment may be entered up as of any term after giving the warrant.

Within a year and a day next after the execution of the warrant, judgment may be entered of course, otherwise a motion must be made in court, or to a judge in vacation, on an affidavit of the due execution of the warrant of attorney, &c. See 2 Lit. Abr. 629.

By 3 Geo. 4. c. 39. s. 1., warrants of attorney, or copies, &c. &c. shall be filed within 21 days after the execution thereof. By s. 2. if not filed, &c. they are, in certain cases, made void as against assignees under a commission of bankrupt. By s. 3. cognovits are placed under the same regulations.

WASH, the fermentable liquor used by the malt-distillers. See DISTILLATION.

WASHINGS, among goldsmiths, are the small particles of gold, and silver, which have been rubbed off in the manufacture of any article, and which are again collected together.

WATCHES, (GER. *Uhren*, *Taschenuhren*. DU. *Zakhorologien*, *Zaknurwerken*. DA. *Lommenhr.* SW. *Fik-ur*, *Byssäks-ur*. FR. *Montres*. IT. *Orinoli da tasca*, o *da sacoccia*. SP. *Relojos de faltriquera*. PORT. *Relogios de algibeira*. RUS. *Karmannüe tschasi*;) are movements or machines for the measuring of time, having their motion regulated by a spiral spring.

WATCH, *Striking*, one which, besides the common watch-work for measuring time, has a clock part for striking the hours, so that, properly speaking, they are pocket-clocks.

WATCH, *Repeating*, one that by only pulling a string, pushing in a pin, &c. repeats the hour, half-hour, or quarter, at any time of the day or night.

Watches made by artificers, are to have the makers' names, under the penalty of 20l. 9 & 10 Will. 3. c. 28.

WATERMEN. The names of watermen are to be registered, and their boats shall be 12½ feet long, and 4½ feet broad, or be liable to forfeiture, and none shall ply on the river but such as have been apprentices to watermen for seven years.

No till-boat, row-barge, &c. shall take in above thirty-seven passengers, and three more by the way, nor any other boat above eight passengers, on forfeiture of 5l. for the first offence, and 10l. for the second, &c.; and if any person be drowned where a greater

number is taken in, such waterman to be guilty of felony.

Till-boats used between London bridge, and Gravesend, shall be fifteen tons, and not under, and other boats three tons. Rulers of the watermen's company are to appoint two officers; one at Billingsgate, at high water, and another at Gravesend, to ring a bell for the till-boats, &c. to put off, and those not immediately proceeding in their voyage, with two sufficient men, shall forfeit 5*l.* to be levied on their boats, tackles, &c.

Watermen plying at, or between Windsor and Woolwich, when they do not take their fares directly up, and down, the river, and are detained by their passengers stopping at ships, wharfs, or otherwise, are to be paid by time or distance, at the option of the waterman; (that is to say) if by time, oars at the rate of 6*d.* for every half hour; and scullers 3*d.* for every half hour, in lieu of instead of the rates computed by distance.

Watermen plying between Windsor and Woolwich, when they take their fares directly up, or down, the river, and are detained by passengers for more than half an hour after landing, (being desired by such passengers to wait,) are to be paid for loss of time as follows, that is to say: for oars 6*d.*, and for a sculler 3*d.*, and for any time not exceeding half an hour, from the expiration of the first half hour from the time of such passenger's landing, and so in proportion for every succeeding half hour in which they shall be so detained, over and above the rates computed by distance.

No more than six persons are to be taken into any wherry as one fare, for any of the said prices: nor more than eight persons into any passage-boat, between Windsor and Woolwich.

In London, the lord mayor and court of aldermen have much power in governing the company of watermen, and appointing the fares for plying on the river Thames; and justices for Middlesex, and other adjoining counties, have also power to hear and determine offences, &c.; see 10 Geo. 2. c. 31.

WATERAGE, money paid for carriage of goods and merchandise, &c. by water.

WATER-MARK, the mark or limit of a flood: thus we say, *high-water-mark*, *low-water-mark*, &c.

WATER-MILL, a mill turned by means of water. See **MILLS**.

WATER-PROOF, a term applied to those stuffs, which have undergone certain chemical, or mechanical, processes, and thus become impervious to moisture.

The following simple process is stated to be that employed by the Chinese for rendering cloth water-proof: Let an ounce of white wax be dissolved in one quart of spirits of turpentine; the cloth be immersed in the solution, and then suspended in the

air till it be perfectly dry. The gum known by the name of "Indian rubber," (see **GUM**, *elastic*,) dissolved in spirit, will also render hats, cloths, and leather, impervious to wet.

WAX, (GER. *Wachs*. DU. *Wasch*. DA. *Vox*. SW. *Vax*. FR. *Cire*. IT. *Sp.* and PORT. *Cera*. RUS. and POL. *Wosk*. LAT. *Cera*.) when pure, is of a whitish colour: it is destitute of taste, and has scarcely any smell.

Yellow wax should always be of a good consistence, fine colour, and pleasant smell. The French consider that made in Champagne to be the best.

In Russia, and in America, there is sometimes found, in the trunks of old trees, a sort of black wax, in round bits of the size of a nutmeg. This is produced by a small kind of bees, and when heated has a smell like balm; the Americans make candles of it.

The yellow wax, or bees' wax, used in this country, is principally imported from Poland, and Russia.

Upper Egypt produces large quantities of this article.

From the common yellow wax, by bleaching, is formed *white wax*. The greater the surface is in proportion to the quantity, the sooner, and more perfectly, this operation is performed. The usual way is to melt the wax in hot water, and press it through a strainer of fine linen; it is then poured into shallow moulds. When hardened by cooling, it is taken out, and exposed to the sun and air, sprinkling it now and then with water, and often turning it: by these means it soon becomes white.

The myrtle wax of North America is obtained from the *myrica cerifera*, a shrub which grows abundantly in Louisiana, and other parts. It produces a berry about the size of a pepper-corn. A very fertile shrub yields nearly seven pounds. The berries are picked off, thrown into a kettle, and covered with water to the depth of about half a foot. The water is then boiled, and the berries stirred, and squeezed against the side of the vessel. The wax which they contain is melted out, and swims on the surface. It is skimmed off, passed through a cloth, dried, melted again, and cast into cakes. The wax thus obtained is of a pale green colour. Its specific gravity is 1.0150. It melts at the temperature of 109°; when strongly heated it burns with a white flame, produces little smoke, and during the combustion emits an agreeable aromatic odour. Water does not act upon it. Alcohol, when hot, dissolves 1-20th of its weight, but lets most of it fall again on cooling.

Wax exudes from the leaves of a tree common in many parts of the Brasils, much like the myrtle wax of the northern part of the same continent. It is very abundant, and of excellent quality, and requires no trouble to obtain it, as the tree, from which it is produced, is indigenous, and shades almost

every small habitation in the interior of the country.

WAX-CANDLES, (GER. *Wachstlichter*. DU. *Waschkaarsen*. DA. *Vaxlys*. SW. *Vaxljus*. FR. *Bougies, bierges*. IT. *Candele di cera*. SP. *Bujías*. PORT. *Bogias, Velas de cera*.) are made from bleached wax. See **CANDLE**.

WEARING APPAREL. Ready-made clothes, more technically denominated *wearing apparel*, have recently become an article of considerable interest in commerce, as well for exportation, as for home consumption. America, the British West India islands, and our new settlements in the South Seas, take off immense quantities, both new, and half worn, or second-hand. This trade, especially in the second-hand articles, is principally, but by no means exclusively, as some have supposed, in the hands of the English Jews, who have correspondents of their own religious persuasion in all parts of the world. Wearing apparel is the subject of particular *protection* in this country by special statute, (6 Geo. 1. c. 23.) which makes it felony, subject to transportation for seven years, to "assault any person in the streets or public highways, *with intention to tear, spoil, cut, or deface the garments or clothes of any person.*" It is also the subject of several *prohibitions* by various statutes. The following are the principal objects of them, under the general denomination of *wearing apparel*.

Brocades of silk, shall not be imported, or sold, under pain of forfeiture of the articles, and a penalty of 100*l.*; but not to extend to *wearers* of the same. 22 Geo. 2. c. 56.

Calicoes, painted, dyed, printed, or stained in Persia, China, or East India, being the manufacture of those places, shall not be sold, or worn, under pain of forfeiture of the articles, and a penalty of 200*l.*, by 11 & 12 W. 3. c. 10.

Fringes, girdles, ribbands, buttons, &c. of foreign manufacture, shall not be sold on pain of forfeiture, and penalty of 50*l.*; nor imported under penalty of 100*l.*, by 15 & 14 Car. 2. c. 12. and 4 W. & Mar. c. 10. but not to extend to wearers.

Gloves and mitts of silk or leather, of foreign manufacture, prohibited to be imported, on pain of forfeiture, and under a penalty of 200*l.* for selling, or concealing the same; but not to extend to persons using the same as part of their wearing apparel only, 6 Geo. 3. c. 19. — So gloves and mitts of other materials, of foreign manufacture, prohibited by 5 Eliz. c. 7., and extended to leather cut into shapes for gloves or mitts, by 25 Geo. 3. c. 55.

Lace, as well silk, as thread, of foreign manufacture, is prohibited to be imported or *be possessed for sale*: the former by 43 Geo. 3. c. 68.; the latter by 46 Geo. 3. c. 81.; without paying certain duties imposed thereon

by 49 Geo. 3. c. 48., under penalties of 50*l.* respectively.

Silk Stockings, of foreign manufacture, are prohibited by 5 Geo. 3. c. 48., under the like penalties, and with the like exception as to wearers, as *gloves, mitts, &c. ante*.

Velvets, of foreign manufacture, are prohibited by 26 Geo. 2. c. 21., in like manner, and with the like exception, as *brocades*, (see *ante*) by 6 Geo. 3. c. 28.

Lastly, *silk handkerchiefs*, the manufacture of Persia, China, or the East Indies, are prohibited from being sold, or exposed to sale, or worn, in Great Britain, and rendered liable to seizure and a penalty of 200*l.*

WEAVERS. The wages of journey-men weavers in London, are to be settled by the lord mayor, recorder, and aldermen. Masters giving more wages than is appointed, to forfeit 50*l.*; and journeymen demanding, or combining to demand more, to forfeit 40*s.*, or be imprisoned three months. See *title SILK*.

WEB, a tissue, or texture, formed of threads interwoven with each other; some whereof are extended in length, and called the warp; and others drawn across, and called the woof. See **WARP**.

WEFT, the woof of cloth. See **WEB**.

WEIGH, WAX, or WEX, a weight of cheese, wool, &c. containing 256 pounds avoirdupois. Of corn, the weigh contains 40 bushels; of barley or malt, six quarters. In some places, as Essex, the weigh of cheese is 300 pounds. See **WEIGHTS** and **MEASURES**.

WEIGHTS and **MEASURES**, are used to ascertain the quantities of any article or commodity, according to its nature, and are a branch of the king's prerogative.

Tables of English Weights.

TROY WEIGHT.		Marked
24 grains	1 pennyweight	dwt.
20 pennyweights	1 ounce	oz.
12 ounces	1 pound	lb.
25 pounds	$\frac{1}{4}$ hundred weight	qr.

WEIGHT OF FIG LEAD, at sundry Places.

At Stockton on Tees,	22 cwt.	of 112 lb.	of fodder	2464 lb.
Chester - - -	20	120	ditto	2400
Newcastle upon Tyne	21	112	ditto	2352
Hull - - -	19½	120	ditto	2340
Leith - - -	20	112	ditto	2240
London - - -	19½	112	ditto	2184

The moneyers, jewellers, &c. have a particular class of weights for gold and precious stones, viz. *carat* and *grain*; and for silver, the *pennyweight* and *grain*. The moneyers have also a peculiar subdivision of the troy-grain; thus divided:

the grain into 20 mites,
the mite into 24 droits,
the droit into 20 periot,
the periot into 24 blanks.

Under king Richard the First it was ordained, that there should be only one weight, and one measure, throughout the nation; and that the custody of the assize or standard of the weights, and measures, should be committed to certain persons in every city and borough; from whence the ancient office of king's alnager seems to have been derived. These original standards were called *pondus regis* and *mensura domini regis*, and are directed, by a variety of subsequent statutes, to be kept in the exchequer-chamber, by an officer called the clerk of the market, except the wine-gallon, which is committed to the city of London, and kept in Guildhall.

The Scottish standards are distributed among the oldest boroughs. The elward is kept at Edinburgh; the pint at Stirling; the pound at Lanark; and the firiot at Linlithgow.

The two principal weights established in Great Britain, are troy weight, and avoirdupois weight. Under the head of the former it may farther be added, that a carat is a weight of four grains; but when the term is applied to gold, it denotes the degree of fineness. Any quantity of gold is supposed to be divided into 24 parts. If the whole mass is pure, it is said to be twenty-four carats fine; if there are twenty-three parts of pure gold, and one part of alloy or base metal, it is said to be twenty-three carats fine, and so on.

Pure gold is too soft to be used for coin. The standard coin of this kingdom is twenty-two carats fine. A pound of standard gold is coined into 44½ guineas, and therefore every guinea should weigh 5 dwts. 9⅓ grains.

A pound of silver coin contains 11oz. 2 dwts. pure silver, and 18 dwts. alloy; and standard silver plate 11 oz. pure silver, with one ounce alloy. A pound of standard silver is coined into 62 shillings; and, therefore, the weight of a shilling should be 5 dwts. 20⅔ grains.

By the 27th chapter of Magna Charta, the weights all over England are to be the same; but for different commodities, there are two different sorts, viz. troy weight, and avoirdupois weight. The origin from which they are both raised, is a grain of wheat gathered in the middle of the ear.

By troy weight we weigh gold, silver, jewels, and liquors. The apothecaries also use the troy pound, ounce, and grain; but they differ from the rest in the intermediate divisions. They divide the ounce into eight drachms; the drachm into three scruples; and the scruple into twenty grains.

By avoirdupois weight we weigh mercury and grocery wares, base metals, wool, tallow, hops, hemp, flax, drugs, bread, &c. In avoirdupois weight, the pound contains 16 ounces; but the ounce is less by near one-twelfth than the troy ounce; the latter containing 490 grains, and the former only 448. The ounce contains 16 drachms: 80 ounces avoirdupois are only equal to 73 ounces troy; and 17 pounds troy equal to 14 pounds avoirdupois.

Mr. Ferguson gives the following comparison between troy and avoirdupois weight.

175 Pounds troy are equal to 144 pounds avoirdupois.

175 Ounces troy are equal to 192 ounces avoirdupois.

One pound troy contains 5760 grains.

One pound avoirdupois contains $437\frac{1}{2}$ grains.

One drachm avoirdupois contains 27.34375 grains.

One pound troy contains 13oz. 2.651428576 drachms avoirdupois.

One avoirdupois pound contains 1 lb. 11 dwts. 16 gr. troy.

Therefore the avoirdupois pound is to the pound troy as 175 to 144; and the avoirdupois oz. is to the troy oz. as $437\frac{1}{2}$ is to 480.

Other nations have also certain weights peculiar to themselves: thus Spain has its arrobas, containing 25 Spanish pounds, or one-fourth of the common quintal: its quintal macho, containing 150 pounds, or one-half common quintal, or 6 arrobas: its adarme, containing one-sixteenth of its ounce. And for gold, it has its castillan, or $\frac{1}{160}$ of a pound; and its tomin, containing 12 grains, or one-eighth of a castillan. The same weights are used in the Spanish West Indies.

Portugal has its arroba, containing 32 Lisbon arratals, or pound: Savary also mentions its faratelle, containing two Lisbon pounds; and its rottolis, containing about 12 pounds. And for gold, its chego, containing four carats. The same weights are used in the Portuguese settlements in the East Indies, Brazil, &c.

Italy, and particularly Venice, have their migliaro, containing four mines; the mine, containing 30 Venice pounds; the saggio, containing one-sixth part of an ounce. Genoa has five kinds of weights, viz. large weights, whereby all kinds of merchandise are weighed at the custom-house; cash-weights for piastres, and other specie; the cantara or quintal, for the coarsest commodities; the large balance for raw silks, and the small balance for the fine commodities.

Sicily has its rottolo, $32\frac{1}{2}$ lb. of Messina.

Germany, Flanders, Holland, the Hanse towns, Sweden, Denmark, Poland, &c. have their schippondt, which at Antwerp and Hamburg is 500 pounds; at Lubeck, 320; and at Coningsburg, 400 pounds.

In Sweden, the schippondt for copper is 320 pounds, and for provisions, 400 pounds. At Riga and Revel, the schippondt is 400 pounds; at Dantzic, 340 pounds; in Norway, 300 pounds; at Amsterdam, 300; containing 20 lyspondts, each weighing 15 pounds.

In Muscovy, they weigh their large commodities by the bercheroct, or berkewits, containing 400 of their pounds. They have also the poet, or poede, containing 40 pounds, or one-tenth of the bercheroct.

New French Weights.

$103\frac{100}{69}$	pounds (poids de marc)	= 112 lb. avoirdupois.
$138\frac{100}{32}$	pounds apothecaries' weight	= 112 ditto.
$50\frac{100}{60}$	kilogrammes	= 112 ditto.
$507\frac{100}{9}$	hectogrammes	= 112 ditto.

A TABLE of the Conformity of Weights of the principal Places in Europe with each other.

N.B. By Observations at the Custom-house in London, 100 lb. Dantzick Weight makes 96 lb. Avoirdupois in London; 106 lb. of Germany makes 112 lb. in London; 104 lb. Dutch Weight makes 112 lb. in London; and the Weights of Italy are commonly between 23 and 25 per Cent. lighter than the Avoirdupois Weight of London.

By means of this and the preceding Table, may be easily seen the agreement which the weights of one place have with those of another; as, for example, if it be wanted to know how many pounds 100 English make at Amsterdam, look for London in the first column, and from thence along the line to the column under Amsterdam, and it will there be found, that 91 lb. 8 oz. Dutch correspond with 100lb. English; and so with any other weight sought for, and *vice versa*.

WEI

The correspondence between English weights and some modern weights in France and other countries :

ENGLISH WEIGHTS.

<i>Troy Weight.</i>					
lb.	oz.	dms.	scr.	grains.	grammes
1	= 12	= 96	= 288	= 5760	= 372.99
	1	= 8	= 24	= 480	= 31.08
		1	= 3	= 60	= 3.885
			1	= 20	= 1.395
				1	= 0.06475

Avoirdupois Weight.

1	= 16	= 256	= 7000	= 453.25
	1	= 16	= 437.5	= 28.32
		1	= 27.975	= 1.81

GERMAN.

71 lbs. or grains English troy	= 74 lbs. or grains German apothecaries' weight.
1 oz. Nuremberg, medic. weight	= 7 drs. 2 scr. 9 grains English.
1 mark Cologne	= 7 oz. 2 dwt. 4 grains English troy.

DUTCH.

1 lb. Dutch	= 1 lb. 3 oz. 16 dwt. 7 grains English troy.
787½ lb. Do.	= 1038 lbs. Do.

SWEDISH WEIGHTS, *used by Bergman and Scheele.*

The Swedish pound, which is divided like the English apothecary, or troy, pound, weighs 6556 grains troy.

The kanne of pure water, according to Bergman, weighs 42250 Swedish grains, and occupies 100 Swedish cubical inches. Hence the kanne of pure water weighs 48088.719444 English troy grains, or is equal to 189.9415 English cubic inches; and the Swedish longitudinal inch is equal to 1.238435 English longitudinal inches.

From these data the following rules are deduced :

1. To reduce Swedish longitudinal inches to English, multiply by 1.2834, or divide by 0.80747.
2. To reduce Swedish to English cubical inches, multiply by 1.9, or divide by 0.5265.
3. To reduce the Swedish pound, ounce, dram, scruple, or grain, to the corresponding English troy denomination, multiply by 1.1382, or divide by 8.786.
4. To reduce the Swedish kannes to English wine pints, multiply by .1520207, or divide by 6.57804.
5. The lod, a weight sometimes used by Bergman, is the 32d part of the Swedish pound; therefore to reduce it to the English troy pound, multiply by .03557, or divide by 28.1156.

Correspondence of English Weights with those used in France before the Revolution.

The Paris pound, pois de marc of Charlemagne, contains 9216 Paris grains; it is divided into 16 ounces, each ounce into 8 gros, and each gros into 72 grains. It is equal to 7561 English troy grains.

The English troy pound of 12 ounces contains 5760 English troy grains, and is equal to 7021 Paris grains.

The English avoirdupois pound of 16 ounces contains 7000 English troy grains, and is equal to 8538 Paris grains.

To reduce Paris grains to English troy grains, divide by } 1.2189.

To reduce English troy grains to Paris grains, multiply by }

To reduce Paris ounces to English troy, divide by } 1.015734.

To reduce English troy ounces to Paris, multiply by }

Or the conversion may be made by means of the following tables.

1. To reduce French to English Troy Weight.

The Paris pound -	=	7561	} Eng. troy grains.
The ounce -	=	472.5625	
The gros -	=	59.0703	
The grain -	=	.8204	

2. To reduce English Troy to Paris Weight.

The English troy pound of 12 oz. =	7021	} Paris grains.
The troy ounce -	= 585.0893	
The dram of 60 grains -	= 75.1354	
The dwt. or denier, of 24 grains =	29.2541	
The scruple of 20 grains =	24.3784	
The grain -	= 1.2189	

3. To reduce English Avoirdupois to Paris Weight.

The avoirdupois pound of 16 ounces, or 7000 troy grains = 8538

The ounce

} Paris grains.
= 555.6250

Weights used in the several parts of Asia, the East Indies, China, Persia, &c.

In Turkey, at Smyrna, &c. they use the

batman, or batteman, containing six occos, theocco weighing three pounds 4-5ths English. They have another batman much less, consisting, as the former, of six occos; but theocco only containing 15 ounces English; 44 occos of the first kind make the Turkish quintal.

At Cairo, Alexandretta, Aleppo, and Alexandria, they use the rotto, rotton, or rottoli; at Cairo, and other parts of Egypt, it is 144 drachms, being above an English pound weight.

At Aleppo there are three sorts of rottos; the first, 720 drachms, making about seven pounds English, and used in weighing cottons, galls, and other large commodities; the second is 624 drachms, used for all silks but white ones, which are weighed by the third rotto of 700 drachms.

At Seyda the rotto is 600 drachms.

The other parts of the Levant, not here named, use some of these weights, particularly theocco or occua, the rottoli, and rotto.

The Chinese weights are the piece, for large commodities; it is divided into 100 catis, or cattis, though some say 125; the cati into 16 taels, or tales, each tale equivalent to $1\frac{1}{3}$ of an ounce English, or the weight of one rial and 1-12th, and containing 12 mas, or masses; and each mas 10 condrens. So that the Chinese piece amounts to 137 pounds English avoirdupois, and the cati to one pound eight ounces. The picol for silk contains 66 catis and 3-4ths; the bahar, bakaire, or barr, contains 300 catis.

Tonquin has also the same weights, measures, &c. as China.

Japan has only one weight, viz. the cati, which, however, is different from that of China, as containing 20 taels.

At Surat, Agra, and throughout the states which composed the kingdom of the Great Mogul, they use the man, or maund, whereof they have two kinds; the king's man, or king's weight, and the man simply; the first used for the weighing of common provisions, containing 40 seers or seres, and each seer just a Paris pound.

The common man, used in the weighing of merchandise, consists likewise of 40 seers; but each seer is only estimated at 12 Paris ounces, or 3-4ths of the other seer.

The man may be looked on as the common weight of the East Indies, though under

some difference of name, or rather of pronunciation, it being called mas at Cambaya, and in other places, mein and maun. The seer is properly the Indian pound, and of universal use; the like may be said of the bahar, tael, and cattai above-mentioned.

At Siam, the weights are the piece containing two shans, or cattis; but the Siamese cattai is only half the Japanese, the latter containing 20 taels, and the former only 10; though some make the Chinese cattai only 16 taels, and the Siamese eight. The tael contains four baats, or ticals, each about a Paris ounce; the baat four selings, or mayons; the mayon two fouangs; the fouang four payes; the paye two clams; the sompaye half a fouang. It is to be observed, that these are the names of their coins as well as weights; silver and gold being commodities there sold, as other things, by their weights.

In the isle of Java, and particularly at Bantam, they use the gantan, equal to nearly three Dutch pounds. In Golconda, at Visapour, and Goa, they have the furatelle, containing one pound 14 ounces English: the mangalis, or mangelin, for weighing diamonds and precious stones, weighing at Goa five grains, at Golconda, &c. $5\frac{1}{2}$ grains. They have also the rotolo, containing $14\frac{1}{4}$ ounces English; the metricol, containing the sixth part of an ounce; the wall for piastres and ducats, containing the 73d part of a rial.

In Persia they use two kinds of batmans, or mans: the one called cahi, or cheray, which is the king's weight; and the other batman of Tauris. The first weighs thirteen pounds ten ounces English; the second $6\frac{1}{2}$ pounds; its divisions are the ratel, or a sixteenth; the derhem, or drachm, which is the fiftieth; the meschal, which is half the derhem: the dung, which is the sixth part of the meschal, being equivalent to six carat-grains; and lastly, the grain, which is the one-fourth part of the dung. They have also the vakie, which exceeds a little our ounce; the sah-cheray, equal to the 1170th part of the derhem; and the toman, used to weigh out large payments of money without telling, its weight is that of fifty abassis.

American weights.—The several European colonies make use of the weights of the states or kingdoms of Europe they belong to. For, as to the aroue of Peru, which weighs twenty-seven pounds, it is evidently no other than the Spanish arroba, with a little difference in the name.

As to the weights of Africa, there are few places that have any, except Egypt, and the countries bordering on the Mediterranean, whose weights have been already enumerated among those of the ports of the Levant. The island of Madagascar, indeed, has weights, but none that exceed the drachm, nor are they used for any thing but gold and silver.

By stat. 35 Geo. 3. c. 102. amended by 37 Geo. 3. c. 143. the justices in sessions, in

every county, are required to appoint persons to examine the weights and balances within their respective jurisdictions. These inspectors may seize and examine weights in shops, &c. and seize false weights and balances, and the offender, being convicted before two justices, shall be fined from five to twenty shillings.

Persons obstructing the inspectors to forfeit from five to forty shillings.

Inspectors to be recompensed out of the county-rate. Standard weights to be purchased by the sessions out of the county-rate, and produced to all persons paying for the production thereof. Informations to be within one month.

Of Measures.

The standard of measures was originally kept at Winchester, which measure was, by the law of king Edgar, ordained to be observed throughout the kingdom.

The English lineal standard is the yard, containing three English feet, equal to three Paris feet, one inch and $\frac{3}{12}$ ths of an inch, or $\frac{7}{9}$ ths of a Paris ell. The use of this measure was established by Henry I. of England, and the standard taken from the length of his own arm. The English ell is equal to a yard and a quarter, or forty five inches, and is used in measuring linens imported from Germany and the Low Countries.

The Scots ewand, was established by king David I. and divided into thirty-seven inches. The standard is kept in the council chamber of Edinburgh, and being compared with the English yard, is found to measure thirty-seven and one-fifth; and therefore the Scots inch and foot are larger than the English, in the proportion of 180 to 185; but this difference being so inconsiderable, is seldom attended to in practice. The Scotch ell, though forbidden by law, is still used for measuring some coarse commodities, and is the foundation of the land-measure of Scotland.

Itinerary measure is the same both in England and Scotland.

The length of the chain is four poles, or twenty-two yards; eighty chains make a mile. The old Scots computed miles were generally about a mile and a half each.

The reel of yarn is $2\frac{1}{2}$ yards, or ten quarters, in circuit; 120 threads make a cut, twelve cuts make a hasp or hank, and four hanks make a spindle.

The French standard was formerly the aune, or ell, containing three Paris feet, seven inches, eight lines, or one yard and $\frac{2}{7}$ ths English; the Paris foot royal exceeding the English by $\frac{6}{1000}$ parts, as in one of the following tables. This ell is divided two ways, viz. into halves, thirds, sixths, and twelfths; and into quarters, half-quarters, and sixteenths.

The French, however, have also formed an entirely new system of weights and measures according to the following table:

PRINCIPAL MEASURES OR UNITIES.

Proportions of the measures of each species to its principal measure or unity.	First part of the name which indicates the proportion to the principal measure or unity.	Length.	Capacity.	Weight.	Agrarian.	For firewood.
10000 1000 100 10 0 0.1 0.01 0.001	Myria Kilo Hecto Deca — Deci Centi Milli	Metre.	Litre.	Gramme.	Arc.	Stere.
Proportion of the principal measures between themselves and the length of the meridian.	- - -	10,000,000th part of the distance from the pole to the equator.	A decimetre cube.	Weight of a centimetre cube of distilled water.	100 square metres.	One cubic metre.
Value of the principal measures in the ancient French measures	- - -	3 feet, 11 lines, and one half nearly.	1 pint and 1-20th, or 1 litron and 1-4th nearly.	18 grains and 841,000 parts.	Two square perches <i>des eaux et forêt.</i>	1 demi-voite, or 1-4th of a cord <i>des eaux et forêt.</i>
Value in English measures	- - -	Inches, 59.383.	61.083 inches, which is more than the wine and less than the beer quart.	22.966 grains.	11968 square yards.	—

The Paris foot expressed in decimals is equal to 1.0654 of the English foot, or contains 12.785 English inches.

The standard in Holland, Flanders, Sweden, a good part of Germany, many of the Hanse Towns, as Dantzic, and Hamburgh, and at Geneva, Frankfort, &c. is likewise the ell; but the ell in all these places differs from the Paris ell. In Holland it contains one Paris foot, eleven lines, or four-sevenths of the Paris ell. The Flanders ell contains two feet, one inch, $5\frac{1}{2}$ lines, or seven-twelfths of the Paris ell. The ell of Germany, Brabant, &c. is equal to that of Flanders.

The Italian measure is the braccio, brace, or fathom. This obtains in the states of Modena, Venice, Florence, Lucca, Milan, Mantua, Bologna, &c. but is of different lengths. At Venice it contains one Paris foot, eleven inches, three lines, or eight-fifteenths of the Paris ell. At Bologna, Modena, and Mantua, the brace is the same as at Venice. At Lucca it contains one Paris foot, nine inches, ten lines, or half a Paris ell. At Florence it contains one foot, nine inches, four lines, or 49-hundredths of a Paris ell. At Milan, the brace for measuring silks is one Paris foot, seven inches, four lines, or four-ninths of a Paris ell; that for woollen cloths is the same with the ell of Holland. At Bergama, the brace is one foot, seven inches, six lines, or five-ninths of a Paris ell. The usual measure at Naples, however, is the canna, containing six feet, ten inches, and two lines, or one Paris ell and fifteen-seventeenths.

The Spanish measure is the vara, or yard, in some places called the barra; containing seventeen-twenty-fourths of the Paris ell. But the measure in Castile and Valencia is the pan, span, or palm; which is used, together with the canna, at Genoa. In Arragon, the vara is equal to a Paris ell

and a half, or five feet, five inches, six lines.

The Portuguese measure is the cavedos, containing two feet, eleven lines or four-sevenths of a Paris ell; and the vara, 106 whereof make 100 Paris ells.

The Piedmontese measure is the ras, containing one Paris foot, nine inches, ten lines, or half a Paris ell.

In Sicily, their measure is the canna, the same with that of Naples.

The Muscovite measures are the cubit, equal to one Paris foot, four inches, two lines; and the arcin, two whereof are equal to three cubits.

The Turkish and Levant measures are the picq, containing two feet, two inches, and two lines, or three-fifths of the Paris ell.

The Chinese measure is the cobre, ten whereof are equal to three Paris ells.

In Persia, and some parts of the Indies, the gueze, of which there are two kinds: the royal gueze, called also the gueze mankelser, containing two Paris feet, ten inches, eleven lines, or four-fifths of the Paris ell; and the shorter gueze, called simply, gueze, only two-thirds of the former. At Goa and Ormuz, the measure is the vara, the same with that of the Portuguese.

In Pegu, and some other parts of the Indies, the cando or candi, equal to the ell of Venice. At Goa, and other parts, they use a large cando, equal to seventeen Dutch ells, exceeding that of Babel and Balsora by seven-eighths per centum, and the vara by six and a half. In Siam they use the ken, short of three Paris feet by one inch. The ken contains two soks, the sok two keubs, the keub, twelve nious, or inches, the nious to be equal to eight grains of rice, i. e. to about nine lines.

At Camboia they use the haster; in Japan the tatam; and the span on some of the coasts of Guinea.

The Ell of Noremberg is equal to that of Amsterdam; the Ell of Osnaburg to that of England; and the Ell of Bern, Basil, &c. to that of Hamburgh.

A TABLE of the Conformity of LONG MEASURES of the principal Places of Europe, with each other.

N. B. By Observation at the Custom-house in London, 100 Auns of Flanders and Holland make $58\frac{1}{2}$ Ells English in London, 100 Auns of Germany and the East Countries 49 Ells in London, 100 Ashin from Russia 57 Ells in London, and 100 Turkey Picos $43\frac{1}{2}$ Ells in London.

By means of this and the preceding table may be easily seen the agreement, which the measures of one place have with those of another, as for example; if it is wanted to know how many ells 100 of Amsterdam make at Brabant, look for Amsterdam in the first column, and from thence along the line to the column under Brabant, and will there be found, that 100 ells of Amsterdam correspond with 98½ ells of Brabant, and so with any other measure sought for, and *vice versa*.

TABLES OF ENGLISH MEASURES.

					21 Chald. of coals	1 Score	-	Score	

Cubical Measures, or Measures of Capacity for Liquids.

The English measures were originally raised from troy-weight, it being enacted by several statutes, that eight pounds troy of wheat, gathered from the middle of the ear, and well dried, should weigh a gallon of wine measure, the divisions, and multiples, whereof were to form the other measures; at the same time it was also ordered, that there should be but one liquid measure in

the kingdom; yet custom has prevailed, and there having been introduced a new weight, viz. the avoirdupois, we have now a second standard gallon adjusted thereto, and therefore exceeding the former in the proportion of the avoirdupois weight to troy weight. From this latter standard are raised two several measures, the one for ale, the other for beer.

The sealed gallon at Guildhall, which is the standard for wines, spirits, oils, &c. is supposed to contain two hundred and thirty-

one cubic inches, and on this supposition the other measures raised therefrom, will contain, as in the table underneath; yet by actual experiment made in 1688, before the lord-mayor and the commissioners of excise, this gallon was found to contain only two hundred and twenty-four cubic inches: it was, however, agreed to continue the common supposed contents of two hundred and thirty-one cubic inches: so that all comput-

ations stand on their old footing. Hence, as twelve is to two hundred and thirty-one, so is fourteen and 12-20ths to $281\frac{1}{2}$, the cubic inches in the ale gallon; but in effect the ale quart contains $70\frac{1}{2}$ cubic inches, on which principle the ale and beer gallon will be two hundred and eighty-two cubic inches. The several divisions and multiples of these measures, and their proportions, are exhibited in the following tables:

N. B. The English square or superficial measures are raised from the yard of 36 inches multiplied into itself, and thus producing 1296 square inches in the square yard: the divisions of this are square feet and inches; and the multiples, poles, roods, and acres, as in the above table.

Roman Square-measure reduced to English.

✠ The integer was the jugæum or acre, which the Romans divided like the libra or as: thus, the jugæum contained,

	Square feet.	Scrup.	Eng. roods.	Square poles.	Square feet.

A TABLE of FOREIGN MEASURES, shewing their EXACT CONTENTS
in ENGLISH MEASURE.

<i>Alicant.</i>	The cahiz or cassisse, corn measure = 7 Winchester bushels. The cantara, liquid measure = 5 gallons English. The vara, cloth measure, 107 varas = 100 yards ditto.
<i>Amsterdam.</i>	The last, corn measure = $10\frac{1}{2}$ quarters Winchester. The aum of 56 stoops, liquid measure = 39 gallons English. The virtel, 30 virtels, ditto = 58 ditto. The quardeel, of 90 stoops, ditto = 100 ditto. The aun or ell, cloth measure, $1\frac{1}{2}$ aun = 1 ell English.
<i>Antwerp,</i> <i>Brussels, &c.</i>	The hectrolitre, corn measure, $50\frac{3}{4}$ hectrolitres = $10\frac{1}{2}$ quarters Winchester. The litre, liquid measure, $3\frac{3}{4}$ litres = 1 gallon English. The aune or ell, cloth measure = $\frac{3}{4}$ yard ditto.
<i>Archangel.</i>	See Petersburg.
<i>Augsburg.</i>	The schaf, corn measure, $6\frac{1}{2}$ schafs = $10\frac{1}{2}$ quarters Winchester.
<i>Barcelona.</i>	The quarters, corn measure = 2 bushels ditto. The pipa of wine or brandy, called the regular pipe = 118 gallons English.
<i>Bayonne.</i>	See Paris.
<i>Bergen.</i>	The last, corn measure, sold per barrel = 4 bushels Winchester. The ell, cloth measure = 24 inches English. The palm, timber measure = $41\frac{7}{8}$ lines English.
<i>Berlin.</i>	The scheffel, corn measure, $52\frac{1}{4}$ scheffels = 10 quarters Winchester.
<i>Bilboa.</i>	The fanega, ditto, 50 fanegas = 10 ditto.
<i>Bologna.</i>	The corba, ditto, $38\frac{3}{4}$ corbas = 10 ditto. The Corba, liquid measure, $5\frac{1}{13}$ corbas = 100 gallons English.
<i>Bordeaux.</i>	The hectol, corn measure = $26\frac{1}{4}$ parts, ditto. The boisseau, ditto = 2 bushels English. The litre, liquid measure, $1\frac{1}{10}$ Paris pints, 4 Paris pints = 1 gallon English. Three hectols and 80 libras of brandy = $100\frac{1}{2}$ ditto. The velt = $1\frac{1}{10}$ ditto. The metre, cloth measure = 39 inches English.
<i>Bremen.</i>	The last, corn measure = 11 quarters Winchester. The vertel, 30 vertels, liquid measure = 58 gallons English. The barrel, oil measure, 8 barrels = 1 tun English.
<i>Breslaw.</i>	The scheffel, corn measure, $40\frac{1}{8}$ scheffels = 10 quarters Winchester. The eimer of 80 quarts, liquid measure, $545\frac{1}{8}$ quarts = 100 gallons English.
<i>Cadiz.</i>	The ell, cloth measure, $166\frac{1}{3}$ ells = 100 yards English. The fanega, corn measure, 5 fanegas = 1 quarter Winchester. The fanega of Coca = 110lb. English. For other measures, see Spain.
<i>Cologne.</i>	The malter, corn measure, $17\frac{1}{2}$ malters = 10 quarters Winchester. The viertel, liquid measure, $63\frac{1}{3}$ viertels = 100 gallons English. The grosse ell } cloth measure. { $131\frac{1}{2}$ grosse ells. The kleine ell } { or $159\frac{1}{3}$ kleine ells. } = 100 yards Eng.
<i>Constantinople.</i>	See Smyrna.
<i>Copenhagen.</i>	A barrel of alum or salt = 112lb. English. A barrel of corn = half quarter Winchester. A barrel of oil = 54 gallons English. A vertel, liquid measure = 2 gallons English. The ell or aun = 2 feet ditto.
<i>Corsica.</i>	The stajo, corn measure, 29 stajos = 10 quarters Winchester.
<i>Cyprus.</i>	The medimno, corn measure, $39\frac{1}{17}$ medimnos = 10 ditto.
<i>Dantzic.</i>	The last of wheat, &c. = $10\frac{1}{4}$ ditto, or 82 Winchester bushels.
<i>Elsinore.</i>	See Copenhagen.
<i>Florence.</i>	The staji, corn measure, $120\frac{1}{2}$ staji = 10 quarters English. The barile, oil measure, 12 barile = 100 gallons ditto. The barile, wine measure, $9\frac{1}{2}$ barile = 100 ditto. The fiaschi, liquid measure, 191 fiaschi = 100 ditto. The boccali, ditto, 382 boccali = 100 ditto.
<i>Frankfort</i> <i>on the Maine.</i>	The malter, corn measure, $26\frac{1}{16}$ malters = 10 quarters Winchester. The viertel, wine measure, $51\frac{1}{3}$ viertels = 100 gallons English. Three different ells are used here for measuring cloth, viz. The Frankfort ell, $169\frac{1}{2}$ ells = 100 yards English. The Brabant ell, $152\frac{1}{4}$ ells = 100 ditto. The Paris, aune or ell, 77 ells = 100 ditto.

<i>Salippoli.</i>	<i>See Naples.</i>
<i>Geneva.</i>	The coupe, corn measure, $36\frac{10}{9}$ coupes = 10 quarters Winchester. The char, wine measure, 1 char = 100 gallons English. The ell, cloth measure, 80 ells = 100 yards English.
<i>Genoa.</i>	The mina of 8 quarters, corn measure, $24\frac{10}{51}$ = 10 quarters Winchester.
<i>Gottenburg.</i>	<i>See Stockholm.</i>
<i>Hamburgh.</i>	The last, corn measure = $11\frac{1}{2}$ quarters Winchester. The viertel, liquid measure = 2 gallons English. The steck, ditto, $19\frac{1}{2}$ steck = 252 ditto. The ell, cloth measure, 83 ells = 52 yards English.
<i>Hanover.</i>	The himten, corn measure, $91\frac{3}{4}$ hintens = 10 quarters Winchester. The last of corn = 96 hintens of Brunswick. The stubgen, wine measure, $97\frac{1}{2}$ stubgens = 100 gallons English. The tonne, beer measure, $3\frac{3}{4}$ tonne = 100 ditto. The tonne, honey measure, $3\frac{10}{82}$ tonne = 100 ditto. The ell, cloth measure = 2 feet English.
<i>Japan.</i>	The ink or fatumy, cloth measure, $48\frac{10}{13}$ inks = 100 yards ditto.
<i>Konigsberg</i>	The last, of $56\frac{1}{2}$ scheffels, corn measure = 85 bushels Winchester. The ell, cloth measure, $137\frac{1}{5}$ ells = 100 yards English.
<i>Lyons.</i>	The anée, corn measure, $13\frac{10}{9}$ anées = 10 quarters Winchester. The pot, wine measure, $397\frac{1}{2}$ pots = 100 gallons English. The aune or ell, cloth measure, $78\frac{1}{4}$ aunes = 100 yards English.
<i>Leghorn.</i>	The sack, corn measure, 4 sacks = 1 quarter Winchester, less 4 per cent. The canna of 4 braccio, cloth measure, 155 braccio = 100 yards English. The barrel, oil measure, 28 barrels = 1 tun of 236 gallons English.
<i>Leipsic.</i>	The scheffel, corn measure, $20\frac{1}{2}$ scheffels = 10 quarters Winchester. The eimer, wine measure, 5 eimers, or $314\frac{3}{4}$ kannen = 100 gallons English. The ell, cloth measure, $161\frac{3}{8}$ ells = 100 yards English.
<i>Libau.</i>	The loof, corn measure, $45\frac{10}{62}$ loofs = 10 quarters Winchester.
<i>Lisbon.</i>	For other measures, <i>see Riga.</i> The alquire, corn measure, $2\frac{1}{2}$ alquires = 1 bushel English. The almude, liquid measure, 100 almudes = 437 gallons ditto. The muid, salt measure, 1 muid = $32\frac{1}{2}$ bushels ditto. The pipe, coal measure, 1 pipe of Newcastle coal = $\frac{1}{5}$ of 1 kell ditto. The vara, cloth measure, 5 varas = 6 yards ditto. The covado, ditto, 27 covados = 20 yards ditto.
<i>Lisle.</i>	The raziere, corn measure, $40\frac{1}{5}$ razieres = 10 quarters ditto. The lot, liquid measure, $180\frac{1}{2}$ lots = 100 gallons ditto. The aune or ell, cloth measure, 130 aunes = 100 yards ditto.
<i>Lubeck.</i>	The last, of 96 scheffels, corn measure, 95 scheffels = $10\frac{1}{4}$ quarters ditto. The ell, cloth measure, 14 ells = 9 yards ditto.
<i>Lucca.</i>	The stajo, corn measure, $116\frac{1}{2}$ stajos = 10 quarters ditto. The copa, oil measure, $3\frac{10}{9}$ copas = 100 gallons ditto. The braccio, cloth measure, 151 braccio = 100 yards ditto. The braccio, silk measure, $158\frac{10}{16}$ ditto = 100 ditto.
<i>Madeira.</i>	The alquire, corn measure, 255 alquires = 10 quarters ditto.
<i>Majorca.</i>	The quartera, corn measure, $42\frac{10}{9}$ quarters = 10 ditto. The cortan, oil measure, $91\frac{10}{6}$ cortans = 100 gallons ditto. The canna, cloth measure = $1\frac{7}{8}$ yards ditto.
<i>Malaga.</i>	The fanega, corn measure, 5 fanegas = 1 quarter Winchester. The heaped fanega, ditto = $1\frac{1}{4}$ struck measure.
<i>Malta.</i>	The salm, corn measure = $8\frac{1}{8}$ bushels Winchester. The caffies, liquid measure = $5\frac{1}{4}$ gallons English. The barrel, ditto = 11 ditto.
<i>Mantua.</i>	The cane, cloth measure, is divided into 8 palms = $10\frac{1}{4}$ inches English each. The staro, corn measure, 82 staros = 10 quarters ditto. The braccio, cloth measure, $196\frac{10}{3}$ braccios = 100 yards ditto. The moggio, oil measure, $3\frac{10}{6}$ moggios = 100 gallons ditto.
<i>Marseilles.</i>	The velt, brandy and wine measure = $1\frac{1}{8}$ gallons ditto.
<i>Memel.</i>	The last, of $56\frac{1}{2}$ scheffels, corn measure = $10\frac{1}{2}$ quarters Winchester. The ell, cloth measure, $137\frac{1}{5}$ ell = 100 yards English.
<i>Mian.</i>	The scheffel, corn measure, $2\frac{1}{2}$ scheffels of linseed = 1 barrel ditto. The moggio, corn measure, $20\frac{3}{4}$ moggios = 10 quarters ditto. The braccio, cloth measure, $135\frac{1}{4}$ braccios = 100 yards ditto. The braccio, silk measure, $170\frac{3}{4}$ ditto = 100 ditto.
<i>Minorca.</i>	The quartillos, liquid measure, 66 quartillos = 100 gallons English.
<i>Mocha.</i>	The gudda, liquid measure = 2 gallons ditto. The coved, long measure = 18 inches ditto.

<i>Mocha.</i>	The guz, long measure = 27 inches English
<i>Modena.</i>	The stajos, corn measure, $40\frac{100}{67}$ stajos = 10 quarters English. The braccio, cloth measure, $142\frac{3}{4}$ braccios = 100 yards ditto.
<i>Montpellier.</i>	The settier, corn measure, $55\frac{100}{86}$ settiers = 10 quarters ditto. The muid of 576 pots, wine measure, $560\frac{1}{2}$ pots = 100 gallons ditto. The charge of 128 pots, oil measure, $323\frac{3}{4}$ pots = 100 ditto. The canne, cloth measure, $45\frac{100}{66}$ cannes = 100 yards ditto.
<i>Morocco.</i>	The fanega, corn measure, $52\frac{100}{67}$ fanegas = 10 quarters ditto. The covados, cloth measure, $181\frac{1}{2}$ covados = 100 yards ditto.
<i>Munich.</i>	The schaff, corn measure, $7\frac{100}{88}$ schaffs = 10 quarters ditto. The ell, cloth measure, $109\frac{1}{2}$ ells = 100 yards ditto.
<i>Munster.</i>	The schaffel, corn measure, $99\frac{100}{57}$ scheffels = 10 quarters ditto. The kanne, liquid measure, $110\frac{1}{2}$ kannes = 100 gallons ditto.
<i>Nantes.</i>	The tonneau, corn measure, $1\frac{100}{14}$ tonneau } = 10 quarters ditto. The setier, ditto, or $11\frac{100}{42}$ setiers }
<i>Naples.</i>	The aune or ell, cloth measure, 68 aunes = 100 yards ditto. The tormoli of 45 to 48 rotoli, corn measure = $19\frac{1}{2}$ quarters ditto. The salm, oil measure, $5\frac{1}{2}$ salems = 1 tun of 236 gallons ditto. The pipe of wine or brandy = 132 gallons ditto.
<i>Narva.</i>	See Petersburg.
<i>Nice.</i>	The stajo, corn measure, 74 staji = 10 quarters ditto. The palmo, cloth measure, $146\frac{1}{2}$ palmos } = 100 yards ditto. The raso, ditto, or $166\frac{1}{2}$ rasos }
<i>Oporto.</i>	The milhero of salt = 10 tons ditto. For other measures, see Lisbon.
<i>Osnaburg.</i>	The scheffel, corn measure, $99\frac{1}{2}$ scheffels = 10 quarters ditto. 100 scheffels make the last.
<i>Paris.</i>	The fuder of 672 cannes, liquid measure, $310\frac{1}{2}$ kannes = 100 gallons do. The boisseau, corn measure, $225\frac{100}{13}$ boisseau } = 10 quarters ditto. The decalitre, ditto, or $285\frac{100}{64}$ decalitre }
	The hectolitre, liquid measure, $3\frac{100}{79}$ hectolitres } = 100 gallons ditto. The litre, ditto, $378\frac{100}{69}$ litres }
	The aune, cloth measure, $76\frac{100}{86}$ aunes } = 100 yards ditto. The metre, ditto, or $91\frac{100}{47}$ metres }
	The toise, long measure, $15\frac{100}{64}$ toises } = 100 feet ditto. The pied de roi, ditto, $95\frac{100}{86}$ pied de roi }
	The metre, ditto, $30\frac{100}{49}$ metre }
<i>Parma.</i>	The quartarole, corn measure, of 1 staro = 102lb. of Parma.
	The braccio, cloth measure, $167\frac{1}{3}$ braccios = 100 yards English.
<i>Patras.</i>	The staro, corn measure, $54\frac{100}{27}$ staros = 10 quarters ditto.
	The pike, cloth measure, $153\frac{1}{3}$ pikes } = 100 yards ditto. The pike, silk ditto, 144 ditto }
<i>Pernau.</i>	The loof, corn measure, $43\frac{100}{25}$ loofs = 10 quarters English. The tonne of salt = 1 last ditto. The tonne of linseed, or 24 loofs = 1 ditto.
	The ell, cloth measure, $166\frac{3}{4}$ ells = 100 yards ditto.
<i>Petersburgh</i>	The chetwert, corn measure = $5\frac{3}{10}$ bushels Winchester. 16 chetwerts = 1 last. The arsheen, cloth measure, 9 arsheens = 7 yards English.
	The kruska, beer measure, 3 kruskas = 1 gallon ditto.
<i>Ratisbon.</i>	The metzen, corn measure, 87 metzens = 10 quarters English. 52 ditto of wheat = 1 schaf. 56 ditto of oats = 1 ditto.
	The viertel, wine measure, $106\frac{100}{70}$ viertels = 100 gallons English.
	The ell, cloth measure, $112\frac{100}{80}$ ells = 100 yards ditto.
<i>Revel.</i>	The last, corn measure, or $24\frac{3}{4}$ tonnen = 10 quarters Winchester.
	The ell, cloth measure, 171 ells = 100 yards English.
<i>Riga.</i>	The last of wheat or barley, of 48 loofs = $11\frac{1}{4}$ quarters Winchester. The last of Liverpool salt = $2\frac{1}{2}$ tons English.
	The ell, cloth measure = 24 inches ditto.
<i>Rio Janeiro.</i>	See Lisbon.
<i>Rochelle.</i>	The tonneau of 42 boisseau, corn measure, $2\frac{100}{7}$ tonneau = 10 quarters do. 24 Boisseau = 1 muid. 28 muids = 1 cent of salt.
	The velt, liquid measure, $51\frac{100}{67}$ velts of brandy = 100 gallons English.
<i>Rome.</i>	The rubbo, corn measure, $10\frac{100}{44}$ rubbos = 10 quarters ditto. The boccali, wine measure, $289\frac{100}{49}$ boccali = 100 gallons do. The canna, linen measure, $43\frac{100}{77}$ cannas = 100 yards ditto.

- The canna, cloth and silk measure, 46 cannas = 100 yards English.
 The braccio, linen measure, 144 braccios = 100 yards ditto
 The braccio, cloth and silk measure, $107\frac{100}{66}$ ditto = 100 yards ditto:
Rostock. The last of wheat of 96 scheffels = $15\frac{1}{2}$ quarters ditto.
 The last of oats = 15 ditto.
 The ell of Rostock, $158\frac{100}{18}$ ells = 100 yards ditto.
 For other measures, see Hamburg.
- Rotterdam.** See Amsterdam.
- Rouen.** The setiers, corn measure, $15\frac{100}{98}$ setiers } = 10 quarters ditto.
 The boisseau, ditto, $127\frac{100}{83}$ boisseaus }
 The aune, cloth measure, $17\frac{100}{8}$ aunes } = 100 yards ditto.
 The aune, linen measure, $65\frac{100}{49}$ ditto }
- St. Malo.** The tonneau of $31\frac{1}{4}$ boisseau, corn measure $2\frac{100}{7}$ tonneau = 10 quarters do
 The tonneau of 21 jattes of salt = 2600 lb. ditto.
 The aune, cloth measure, $67\frac{100}{90}$ aunes = 100 yards ditto.
- St. Sebastian.** See Cadiz.
- Santa Cruz.** See Copenhagen.
- Sardinia.** The starello, corn measure, $58\frac{100}{31}$ starellos = 10 quarters ditto.
 The palmos, cloth measure, $564\frac{1}{3}$ palmos = 100 yards ditto.
 The pike, cloth measure, $151\frac{100}{27}$ pikes = 100 yards ditto.
- Sayd.** See Cadiz.
- Seville.** The pike, cloth measure, = $\frac{3}{4}$ yard ditto.
- Smyrna.** 12 fanegas, 48 quartillas, or 144 celemines, corn measure = 1 cahiz.
- Spain.** The fanega, corn measure, $52\frac{100}{7}$ fanegas, or $631\frac{100}{30}$ celemines = 10 quarters English.
 The moyos, wine measure, $1\frac{100}{52}$ moyos, }
 The cantar, ditto, $24\frac{100}{39}$ cantar, } = 100 Gallons ditto.
 The azumbres, ditto, $195\frac{100}{14}$ azumbres, }
 The quartillos, ditto, $780\frac{100}{40}$ quartillos, }
 The arrobas, oil measure, $31\frac{100}{22}$ arrobas, } = 100 gallons, ditto.
 The quartillas, ditto, $124\frac{100}{86}$ quartillos, }
 The libras, ditto, $780\frac{100}{40}$ libras, }
 The vara, cloth measure, $109\frac{100}{30}$ varas, = 100 yards ditto.
- Stettin.** The last of 96 scheffels, corn measure, = $14\frac{1}{4}$ quarters Winchester.
 The berg scheffels, coal measure, $34\frac{1}{3}$ = 1 chaldron English.
 The ell, cloth measure, 14 ells = 9 yards ditto.
 The foot, long measure, 31 feet = 32 feet ditto.
- Stockholm.** The tuma, corn measure, 23 tumas = $10\frac{1}{4}$ quarters, ditto.
 The ell, cloth measure, 57 ells = 37 yards ditto.
- Stralsund.** The scheffell, corn measure, $66\frac{100}{78}$ scheffels of wheat, } = 10 quarters do
 The scheffell, ditto, $62\frac{100}{95}$ ditto of oats, }
 The last of wheat = $14\frac{1}{8}$ ditto.
 The last of oats = $15\frac{1}{8}$ ditto.
 The stubgen, liquid measure, $97\frac{1}{2}$ stabgens = 100 gallons ditto.
- Strasburg.** The sester, corn measure, 156 sester city measure, or } = 10 quarters ditto.
 $151\frac{1}{4}$ ditto country measure, }
 The schoppen, liquid measure, $780\frac{100}{80}$ schoppens = 100 gallons ditto.
 The ell, cloth measure, $76\frac{100}{80}$ } = 100 yards ditto.
 The ell braches, ditto, $169\frac{100}{68}$ }
- Teneriffe.** See Spain.
- Toulon.** The emine, corn measure, 28 emines = 10 quarters English.
 The millerolle, liquid measure, $5\frac{100}{8}$ millerolles = 100 gallons ditto.
 The canne, cloth measure, $47\frac{100}{17}$ cannes = 100 yards ditto.
- Trieste.** The stara, corn measure, = 29 quarters ditto.
 The orna, oil measure, = $5\frac{1}{2}$ casissi, or 107 lb. wt. = 17 gallons, English nearly, or 1414 lb. at Trieste = 236 gallons of oil.
- Tripoli.** The cassisse, corn measure, $8\frac{1}{2}$ cassisse = 10 quarters English.
 The mataro, oil measure, $16\frac{100}{80}$ mataro = 100 gallons ditto.
 The pike, cloth measure, $165\frac{100}{8}$ pikes = 100 yards ditto.
- Tunis.** The cassisse, corn measure, $7\frac{100}{98}$ cassisses = 10 quarters ditto.
 The mataro, oil measure, 20 mataros, } = 100 gallons ditto.
 The mataro, wine measure, 40 mataros }
 The pike, cloth measure, $135\frac{100}{93}$ pikes } = 100 yards ditto.
 The pike, silk measure, 145 ditto, }
 The pike, linen measure, $193\frac{1}{3}$ ditto, }
- Turin.** The emine, corn measure, $149\frac{100}{18}$ emines = 10 quarters ditto.
 The pinti, liquid measure, $241\frac{100}{89}$ pintis = 100 gallons ditto.

	The raso, cloth measure, $151\frac{1.0.0}{5.3}$ rasos = 100 yards English.
<i>Valencia.</i>	<i>See Spain.</i>
<i>Venice.</i>	The staro, or stajo of wheat, $35\frac{1.0.0}{2.7}$ staros = 10 quarters English.
	The miglajo of 40 miri, oil measure, 24 miri = 100 gallons ditto.
	The secchie, wine measure, $58\frac{1.0.0}{3.6}$ secchie = 100 gallons ditto.
	The brachi cloth measure, $137\frac{1.0.0}{1.9}$ brachi, } = 100 yards ditto.
	The brachi, silk measure, $145\frac{1}{2}$ ditto, }
<i>Verona.</i>	The miglajo, of wheat, $77\frac{1}{2}$ minellas = 10 quarters ditto.
	The brenta, of 8 bassi, wine measure, $83\frac{1.0.0}{7.7}$ bassi = 100 gallons ditto.
	The brachi, cloth measure, $145\frac{1}{2}$ brachi = 100 yards ditto.
	The ell, or aune, of oil weighs 1738 lb. peso sottile.
<i>Vienna.</i>	The metzen, corn measure, $40\frac{1.0.0}{7.4}$ metzen = 10 quarters English
	The eimer, liquid measure $6\frac{1.0.0}{3.9}$ eimers } = 100 gallons ditto.
	The maas, ditto, $255\frac{1.0.0}{7.2}$ maas, }
	The ell, or aune, cloth measure, $117\frac{1.0.0}{7.1}$ ells = 100 yards ditto.
<i>Ulm.</i>	The metzen, corn measure, $298\frac{1}{4}$ metzens = 10 quarters ditto.
	The ell, cloth measure, $160\frac{1.0.0}{9.0}$ ells = 100 yards ditto.
<i>Wismar.</i>	The scheffel, corn measure, $69\frac{1.0.0}{8.1}$ scheffels = 10 quarters ditto.
	The ell, cloth measure, $156\frac{1.0.0}{9.2}$ ells = 100 yards ditto.
<i>Zell.</i>	The scheffel, corn measure, $9\frac{1.0.0}{1.9}$ scheffels = 10 quarters ditto.
	The stubgen, liquid measure, $97\frac{1.0.0}{4.7}$ stubgens = 100 gallons ditto.
	The ell, cloth measure, $157\frac{1.0.0}{1.7}$ ells = 100 yards ditto.

WELD, or **WOULD**, (GER. *Wau.* DU. *Wouw, Wouwe.* DA. *Vau.* SW. *Vau, Gaude.* FR. *Gaude.* IT. *Guadarella.* SE. *Gualda.* PORT. *Guada.* POL. *Tarownik.* LAT. *Luteola*.) is a plant cultivated in Kent, Herefordshire, and many other parts of this kingdom. It is likewise very common in the environs of Paris, in most of the French provinces, and in a great part of the rest of Europe. It pushes out long narrow leaves, of a lively green: from the midst of these leaves, the stalk rises to the height of three or four feet, frequently branchy, and furnished with leaves, narrow like the radical ones, but shorter as they approach the flowers, which are disposed in long spikes. The whole of the plant is used for dyeing yellow: though some assert, that the seeds only afford the colouring matter.

Two sorts of weld are distinguished: the bastard or wild, which grows naturally in the fields; and the cultivated, the stalks of which are smaller, and not so high. For dyeing, the latter is preferred, it abounding more in colouring matter. The more slender the stalk, the more it is valued.

When the weld is ripe, it is pulled, dried, and made into bundles, in which state it is used. *See DYEING.*

WELDING-HEAT, in smithery, a degree of heat given to iron, &c. sufficient to make any two bars, or pieces, of iron unite by a few strokes of the hammer, and form one piece.

WHALE-FINS. (GER. *Wallfischbarten, Barten, Baarden.* DU. *Baarden.* DA. and SW. *Baarder.* FR. *Fanons, Barbes.* IT. *Barbe di ballena.* SP. *Baubas de ballena.* PORT. *Barbas de balea.* RUS. *Ursü y Küa.*) *See FISHERY.*

WHALE-OIL. *See TRAIN-OIL, and FISHERY.*

WHARF, a bank, or quay, for landing goods at, as also for shipping off from. Some are of long standing, and set out by commission from the court of exchequer; others of more recent date by statute, as the London Docks, West India Docks, &c. &c.

WHARFAGE. When a wharfinger receives a sum of money for wharfage, portage, and sufferage, according to the custom of trade, he is bound to deliver the goods in safety, on board the destined vessel, and is also responsible for any loss or damage that may be sustained through his negligence. For this responsibility, wharfingers are allowed for rent, landing, weighing, or shipping, the following

Wharfinger's Rates.

		s.	d.
Landing and weighing Coffee,	each bag	-	0 2
	under 5 cwt. per cask	-	0 3

Shipping same as loading.	-	-	-	

WHEAT, (GER. *Weitzen*. DU. *Tarw*. DA. *Hvede*. SW. *Hvete*. FR. *Froment*, *Bled*, *Blé*. IT. *Grano*, *Formento*. SP. and PORT. *Trigo*. RUS. *Pscheniza*. POL. *Pszenica*. LAT. *Triticum*.) a well-known plant, of which there is a great variety of species. Of what country the wheat first introduced into this was a native, is a matter by no means decided; but some recent discoveries seem to intimate that it is of Asiatic origin. What is grown in this country may be divided into two kinds, the smooth or polled, and the rough or bearded. Of each of these there are numerous varieties of established cultivation, and continual additions are almost daily making to them by importation from abroad.

It is customary to set aside, or to purchase for seed-corn, the boldest and plumpest samples that can be obtained; that is, those that contain the most flour; but this is an unnecessary waste of human subsistence; the smallest grains, such as are sifted out before the wheat is carried to market, and either consumed in the farmer's family, or given to his poultry, will be found by experience to answer the purpose of propagating the sort whence they sprang, as effectually as the largest. Every ear of wheat is composed of a number of cups placed alternately on each side of the straw; the lower ones contain, according to circumstances, three or four grains, nearly equal in size, but towards the top of the ear, where the quantity of nutriment is diminished by the supply of those cups that are nearer the root, the third or fourth grain in a cup is frequently defrauded of its proportion, and becomes shrivelled and small. These small grains, which are rejected by the miller, because they do not contain flour enough for his purpose, have, nevertheless, an ample abundance for all purposes of vegetation, and as fully partake of the sap, (or blood, as we should call it in animals,) of the kind which produced them, as the fairest and fullest grain that can be obtained from the bottoms of the lower cups, by the wasteful process of beating the sheaves.

The principal corn countries, from which we draw our supplies of wheat in war-time,

are Poland, Prussia, Russia, Germany, Zealand, the coast of Barbary, and the shores of the Black-Sea. North America also furnishes us with abundance, which, however, we usually receive in the form of flour. See ASIA, AMERICA, and the corn-countries under the article EUROPE. See also FLOUR, and CORN.

WHEEL, *Wheels*, (GER. *Räder*. DU. *Raders*, *Wielen*. DA. *Hjul*. SW. *Hjul*. FR. *Roues*. IT. *Ruote*. SP. *Ruedas*. PORT. *Rodas*. RUS. *Kolessa*. POL. *Kola*.) in mechanics, a simple machine, consisting of a round piece of wood, metal, or other matter, which revolves on an axis. The wheel is one of the principal mechanic powers; it has place in most engines; in effect, it is of an assemblage of wheels, that most of our engines are composed. With respect to wheels of carriages, the use is two-fold, viz. that of diminishing, or more easily overcoming, the resistance or friction from the carriage; and that of more easily overcoming obstacles in the road. In the first case, the friction on the ground is transferred, in some degree, from the outer surface of the wheel, to its nave and axle; and in the latter, they serve easily to raise the carriage over obstacles and asperities met with on the roads.

In both these cases, the height of the wheel is of material consideration, as the spokes act as levers, the top of an obstacle being the fulcrum, their length enables the carriage more easily to surmount them; and the greater proportion of the wheel to the axle serves more easily to diminish, or to overcome the friction of the axle.

2. The wheels should be exactly round; and the felloes at right angles to the naves, according to the inclination of the spokes.

3. It is the general opinion, that the spokes should be somewhat inclined to the naves, so that the wheels may be dishing, or concave. Indeed, if the wheels were always to roll upon smooth and level ground, it would be best to make the spokes perpendicular to the naves, or to the axles; because they would then bear the weight of the load perpendicularly. But because the ground is commonly uneven, one wheel often falls into a cavity, or rut, when the

other does not, and then it bears much more of the weight than the other does, in which case it is thought best for the wheel to be dished, because the spokes become perpendicular in the rut, and therefore have the greatest strength when the obliquity of the roads throws most of the weight upon them; whilst those on the high ground have less weight to bear, and therefore need not be at their full strength.

4. The axles of the wheels should be quite straight, and perpendicular to the shafts, or to the pole.

5. Large wheels are more advantageous for rolling than small ones, both with regard to their power as a longer lever, to the degree of friction, and to the advantage in getting over holes, &c. &c.

6. It would be much more advantageous to make the four wheels of a coach or waggon nearly of a height.

7. The utility of broad wheels, in preserving the roads, has been so generally believed, as to have occasioned the legislature to enforce their use. At the same time, the proprietors and drivers of carriages seem to be convinced, by experience, that a narrow-wheeled carriage is more easily and speedily drawn by the same number of horses, than a broad-wheeled one of the same burthen; because they have less friction on the axle; and the owners of broad-wheeled waggons contrive, in general, to make them as destructive to roads as narrow-wheeled ones, by making the rim of the wheel of unequal diameters, and the waggon consequently to go generally on a sharp and narrow edge. This, however, had become so obvious, that the legislature interfered, by 55 Geo. 3. c. 119. which enacts, that on all turnpike roads throughout England, any seven or more trustees, at any public meeting holden for purposes respecting their turnpike roads, may make an order to exempt from any, or from all, the tolls for additional weight imposed by former statutes, on condition of the carriages "having the soles or bottoms of the felloes of the wheels of the breadth of six inches, or of nine, or of sixteen inches, or upwards, and being *cylindrical*, that is to say, *of the same diameter, on the inside next the carriage, as on the outside*; so that when such wheels shall be rolling on a level surface, the whole breadth thereof shall bear equally on such level surface; and the opposite ends of the axle-trees of such carriages inserted in the naves shall be horizontal, and in the continuance of one short line, and not forming any angle with each other.

WHETSTONE, (GER. *Wetzstein*. DU. *Wetsteen*. DA. *Hvedesteen*. SW. *Brynsten*, *Vettjesten*. FR. *Pierre à aiguiser*. IT. *Pietra d'affilare*. SP. *Piedra de afilar*. PORT. *Pedra de afiar*. RUS. *Totschilnoe kamen*. PORT. *Marmuka*. LAT. *Cos*.) is a kind of sand-stone, dug up chiefly in Derbyshire, and other northern counties; it is of a dusky yellow

colour, resists the action of acids, though permeable to water, being of a rough and coarse grain; this fossil affords a useful article of trade, and is employed for sharpening knives, &c. &c.

WHITE PEPPER. See PEPPER.

WHIP-MAKER This trade is generally combined with that of saddlery. Whips are made with a wooden handle, and whale-bone covered with sheep-gut; and the small round plate at top is furnished by the saddler's founder.

WHISKEY, a spirit obtained by distillation from corn, sugar, or molasses, though generally from the former. Whiskey is the *national spirit*, if we may so term it, of Ireland, and Scotland; but that distilled in the latter country is distinguishable from the Irish by a peculiar smoky flavour. See DISTILLATION, also IRELAND, under the article EUROPE.

WHITE COPPER. See TUTENAG.

WHITE LAC. See LAC.

WHITE LEAD. See CERUSE.

WHITING, chalk cleared of its grosser impurities, ground in a mill, and made up into small loaves, is sold under the name of *whiting*. This article is used for various purposes domestic, and mechanical.

WHOLESALE, a term used in opposition to retail, implying sale in the lump.

WICKER-WORK. See BASKETS.

WILLOW. (GER. *Weide*, *Weidenbaum*. DU. *Wîlg*. DA. *Pîil*. SW. *Pîhl*. FR. *Saule*. IT. *Salcio*, *Salgaro*. SP. *Sauce*, *Salce*. PORT. *Salgueiro*, *Sinceiro*. RUS. *Wetla*, *Tal*, *Jwa*. POL. *Wierzba*. LAT. *Salix*.) The varieties of species of this genus of tree are exceedingly numerous, and all of them highly valuable in different points of view. The wood, or bole, of the willow is useful to the turner, the patten-maker, and picture-frame-maker; also as timber for purposes under water. The larger branches for gates, hurdles, and other agricultural purposes; and the twigs for baskets. The blossoms contain a saccharine juice, which yields an intoxicating liquor on distillation. The leaves of the willow are mentioned by Scheffer, as proper for giving a fine yellow colour to wool, silk, and thread. Bergman asserts, that the leaves of the sweet willow (*laurier saule*), *salix pentandra*, should be employed; and that the leaves of the common willow give a colour, which is for the most part discharged by the sun in a few weeks.

WINDLASS, in a ship, is an instrument in small ships placed upon the deck, just abaft the foremast. It is made of a piece of timber six or eight feet square, in form of an axle-tree, whose length is placed horizontally upon two pieces of wood at the ends, and upon which it is turned about by the help of handspikes put into holes made for that purpose. This instrument serves for weighing anchors, or hoisting of any weight in, or out of, the ship, and will purchase

much more than any capstan, and that without any danger to those who heave; for if in heaving the windlass about, any of the hand-spikes should happen to break, the windlass would pall of itself.

WIND-MILL, a kind of mill, the internal parts of which are much the same with those of a water-mill; from which, however, it differs, in being moved by the impulse of the wind upon its vanes or sails, which are to be considered as a wheel on the axle. See **MILL**.

WIND-SAILS, in a ship, are made of the common sail-cloth, and are usually between 25 and 30 feet long, according to the size of the ship, and are of the form of a cone ending obtusely; when they are made use of, they are hoisted by ropes to about two-thirds, or more, of their height, with their basis distended circularly by hoops, and their apex hanging downwards in the hatchways of the ship; above each of these, one of the common sails is so disposed, that the greatest part of the air rushing against it is directed into the wind-sail, and conveyed, as through a funnel, into the upper parts of the body of the ship.

WIND-TACKLE-BLOCKS, in a ship, are the main double blocks, which, being made fast to the end of a small cable, serve for hoisting goods into the ship, &c.

To **WIND**, or **WEND**, a ship, signifies to bring her head about. How winds or wends a ship? is a question asked by mariners concerning a ship under sail; signifying as much as, upon what point of the compass does she lie with her head?

WINDWARD, in the sea language, denotes any thing towards that point from which the wind blows in respect of a ship: thus windward tide is the tide which runs against the wind.

WIND, *Large*. In the sea language, to sail with a large wind, is the same as with a fair wind.

WINE, (*GER. Wein. Du. Wyn. Da. Sw. and Fr. Vin. Ir. and Sp. Vino. Port. Vinho. Rus. Wino, Winogradnoe winoe. Pol. Wino. LAT. Vinum.*) is an agreeable spirituous liquor, produced by fermentation from those vegetable substances that contain saccharine matter. A very great number of vegetable substances may be made to afford wine (as well as spirit); as grapes, currants, elder-berries, cherries, apples, pulse, turnips, parsnips, &c. but more particularly, as has been lately discovered, the fruit, or apple, growing at the top of the potatoe-plant.

The appellation of wine is, however, in a more particular manner appropriated to the liquor drawn from the fruit of the common vine, *vitis vinifera*.

Of all substances susceptible of the spirituous fermentation, none is capable of being converted into so good wine, as the juice of the grapes of France, or of other countries that are nearly in the same latitude, or in

the same temperature. The grapes of hotter countries, and even those of the southern provinces of France, do indeed furnish wines that have a more agreeable, that is, more of a saccharine taste; but these wines, though they are sufficiently strong, are not so spirituous as those of the provinces near the middle of France; at least, from these latter wines the best vinegar, and brandy, are made. As an example, therefore, of spirituous fermentation in general, we shall describe the method of making wine from the juice of the grapes of France.

This juice, when newly expressed, and before it has begun to ferment, is called must, and in common language sweet wine. It is turbid, has an agreeable, and very saccharine, taste. It is very laxative, and when drunk too freely, or by persons disposed to diarrhoeas, it is apt to occasion these disorders. Its consistence is somewhat less fluid than that of water, and it becomes almost of a pitchy thickness when dried.

When the must is pressed from the grapes, and put into a proper vessel and place, with a temperature between fifty-five, and sixty, degrees, very sensible effects are produced in it, in a shorter, or longer, time, according to the nature of the liquor, and the exposure of the place. It then swells, and is so rarefied, that it frequently overflows the vessel containing it, if this be nearly full. An intestine motion is excited among its parts, accompanied with a small hissing noise, and evident ebullition. The bubbles rise to the surface, and at the same time is disengaged a quantity of carbonic acid of such purity, and so subtle and dangerous, that it is capable of killing instantly men, and animals, exposed to it in a place where the air is not renewed. The skins, stones, and other grosser matters of the grapes are buoyed up by the particles of disengaged air that adhere to their surface, are variously agitated, and raised in form of a scum or soft and spongy crust, that covers the whole liquor. During the fermentation this crust is frequently raised, and broken by the air disengaged from the liquor which forces its way through it; afterward the crust subsides, and becomes entire as before.

These effects continue while the fermentation is brisk, and at last gradually cease; then the crust, being no longer supported, falls in pieces to the bottom of the liquor. At this time, if we would have a strong and generous wine, all sensible fermentation must be stopped. This is done by putting the wine into close vessels, and carrying these into a cellar, or other cool place.

After this first operation, an interval of repose takes place, as is indicated by the cessation of the sensible effects of the spirituous fermentation; and thus enables us to preserve a liquor no less agreeable in its taste, than useful for its reviving and nutritive qualities when drunk moderately.

If we examine the wine produced by this first fermentation, we shall find that it differs entirely and essentially from the juice of grapes before fermentation. Its sweet and saccharine taste is changed into one that is very different, though still agreeable, and somewhat spirituous and piquant.

It has not the laxative quality of must, but affects the head, and occasions, as is well known, drunkenness. Lastly, if it be distilled, it yields, instead of the insipid water obtained from must by distillation with the heat of boiling water, a volatile, spirituous, and inflammable liquor called spirit of wine, or alcohol. This spirit is consequently a new being, produced by the kind of fermentation called the vinous or spirituous.

When any liquor undergoes the spirituous fermentation, all its parts seem not to ferment at the same time, otherwise the fermentation would probably be very quickly completed, and the appearances would be much more striking: hence, in a liquor much disposed to fermentation, this motion is more quick, and simultaneous, than in another liquor less disposed. Experience has shown, that a wine, the fermentation of which is very slow and tedious, is never good or very spirituous; and therefore when the weather is too cold, the fermentation is usually accelerated by heating the place in which the wine is made. A proposal has been made by a person very intelligent in economical affairs, to apply a greater than the usual heat to accelerate the fermentation of the wine, in those years in which grapes have not been sufficiently ripened, and when the juice is not sufficiently disposed to fermentation.

The wine is usually taken out of the fermenting vessels, when fermentation has subsided. The mass being settled, the colour of the liquor is well developed, it having become clear, and its heat having disappeared, it is then put into casks, where, by a second less sensible fermentation, the wine is clarified, its principles combine more perfectly together, and its taste and smell become still more perceptible. If this fermentation be stopped, the gaseous principles are retained, the wine is brisker, and more of the nature of must.

In France, as well as in most of the other wine countries, it is usual to drink the wine in its pure state, or just as it is produced by the grape, without any foreign mixture; and this is so generally practised, that wine in this state has obtained the appellation of *table-wine*, being drunk as freely, as beer is amongst the English. When, however, wine is intended for exportation, it is always necessary, in order to its enduring the sea-voyage, to qualify it, or give it body by brandy. This is more frequently practised in Spain, and Portugal, than in France; and the proportion of brandy employed by the Spanish, and Portuguese, is far greater than

that employed by the French. It is not very unusual with many dealers in wine, in this country, to add a certain portion of brandy to the foreign wines which they import, more particularly if they find, on landing them, that they are thin, poor, or green. In Spain, and Portugal, the best wines are invariably *made up* with French brandy, but those of an inferior quality are usually coopered with Spanish, or Portuguese, spirit. The addition of brandy ought to take place as soon as may be, after the second fermentation, to the end that the spirit and wine may have due time to become incorporated, and to meliorate each other, prior to the exportation of the article.

To give a deep-red colour to wine, it is necessary to make use of black grapes, and to leave them fermenting in their mashed state, previous to the pressing.

The colour of wine is, however, frequently artificial; a deep red is almost always the effect of foreign additions, as red-wood, log-wood, elder-berries, bilberries, &c. In France, no secret is made of these practices, the colouring matters being publicly thrown out after they have been used.

A common practice is, to throw sugar of lead, and alum, among sour wine, in order to sweeten it. These substances being extremely detrimental, it becomes of importance to be able to detect them, when mixed with wine. For this purpose, the following test is furnished.

Mix equal parts of oyster-shells, and crude sulphur in fine powder, put them into a crucible in a wind furnace, bring it suddenly to a white heat, and keep it thus a quarter of an hour. When cold powder it, and keep it in bottles closely stopped. Into a strong bottle put two drachms of this powder, and as much cream of tartar; fill the bottle with water; boil it for an hour, and let it cool: stop the bottle close, shake it well for some time, and then let it settle. Decant the clear liquor into ounce phials, into which twenty drops of muriatic acid have been previously put; and stop them very close with wax, softened with a small portion of turpentine. One part of this liquor, mixed with three of wine, will show the least trace of lead, copper, &c. by a very sensible black precipitate.

For the countries that produce wine, we must refer the reader to article EUROPE.

Wine dealers distinguish the article in which they traffic into two general descriptions; namely, *sweet or luscious wines*, and *dry wines*, or such as are not sweet. The latter are aptly denominated *vins de grave* by the French.

On landing wines in this country, the less they are exposed the better, for they are affected by the seasons, and more or less by the weather. The great art of keeping wines is, to prevent their fretting, which is done by keeping them in the same degree of heat.

For the mode of fining or clarifying wine, see **REFINING**.

The greatest proportion of the wines consumed in this country, is brought from Spain, and Portugal, particularly the latter kingdom; government having always discouraged the importation of French wines by heavy taxes. It is not our province to decide how far these prohibitory laws are founded on good policy. The French wines are certainly the most wholesome, and might be the cheapest.

The consumption of German, French, and Italian wines, is but trifling in Great Britain.

WINE-COOPER, one whose profession it is to *cooper* or *make up* wines, to repair the vessels which contain them, and to taste and even purchase, the article on account of the merchant.

WINE, *Spirit of*. See **SPIRIT OF WINE**, and **ALCOHOL**.

WIRE, (GER. *Draht*. DU. *Draad*. DA. *Traad*. SW. *Tråd*. FR. *Fil d'archal*. IT. *Filo*. SP. *Hilo*. PORT. *Fio*. RUS. *Prowoloka*. POL. *Drot*.) a piece of metal drawn through the hole of an iron into a thread of a fineness answerable to the hole it passed through.

Wires are frequently drawn so fine, as to be wrought along with other threads of silk, wool, flax, &c.

The metals most commonly drawn into wire, are gold, silver, copper, and iron; but platina, brass, and zinc, are also drawn into it occasionally.

Gold wire is made of cylindrical ingots of silver, covered over with a skin of gold, and thus drawn successively through a vast number of holes, each smaller and smaller; till at last it is brought to a fineness exceeding that of a hair. That admirable ductility which makes one of the distinguishing characters of gold, is no where more conspicuous than in this gilt wire. A cylinder of forty-eight ounces of silver, covered with a coat of gold, only weighing one ounce, as Dr. Halley informs us, is usually drawn into a wire, two yards of which weigh no more than one grain; whence ninety-eight yards of the wire weigh no more than forty-nine grains, and one single grain of gold covers the ninety-eight yards, so that the ten-thousandth part of a grain is above one-eighth of an inch long.

Silver wire is the same with gold wire, except that the latter is gilt, or covered with gold, and the other is not.

There are also counterfeit gold, and silver, wires; the first made of a cylinder of copper, silvered over, and then covered with gold; and the second of a like cylinder of copper, silvered over, and drawn through the iron, after the same manner as gold and silver wire.

Brass wire is drawn after the same manner as the former. Of this there are divers sizes, suited to the different kinds of works.

The finest is used for the strings of musical instruments, as harpsichords, &c.

The pin-makers likewise use vast quantities of brass wire to make their pins of.

Iron wire is drawn of various sizes, from half an inch, to one-tenth of an inch, diameter, and even smaller.

The first iron that runs from the stone when melting, being the softest and toughest, is preserved to make wire of. Iron wire is made from bars of iron, called *esleom-iron*, which are first drawn out to a greater length, and to about the thickness of the little finger, at a furnace, with a hammer gently moved by water. These thinner pieces are bored round, and put into a furnace to anneal for twelve hours. A pretty strong fire is used for this operation. After this, they are laid under water for three or four months, the longer the better; then they are delivered to the workmen, called *rippers*, who draw them into wire through two or three holes. After this, they anneal them again for six hours, and water them a second time for about a week, and they are then delivered again to the *rippers*, who draw them into wire of the thickness of a large pack-thread. They are then annealed a third time, and then watered for a week longer, and delivered to the small wire-drawers, called *overhouse-men*.

In the mill where this work is performed, there are several barrels hooped with iron, which have two hooks on their upper sides, on each of which hang two links, which stand across, and are fastened to the two ends of the tongs which catch hold of the wire, and draw it through the hole. The axis on which the barrel moves does not run through the centre, but is placed on one side, which is that on which the hooks are placed; and underneath there is fastened to the barrel a spoke of wood, which they call a *swingle*, which is drawn back a good way by the cogs in the axis of the wheel, and draws back the barrel, which falls to again by its own weight.

The tongs hanging on the hooks of the barrel, are by the workmen fastened to the end of the wire, and by the force of the wheel, the hooks being pulled back, draw the wire through the holes. The plate in which the holes are, is iron on the outside, and steel on the inside; and the wire is anointed with train-oil, to make it run the easier. Great improvements have been made of late years in the machines which perform this operation of wire-drawing, especially by the French, who excel all other workmen in this manufacture. Duties are imposed by divers statutes on wire, both imported, and manufactured at home, especially 24 Geo. 3. c. 41, 43 Geo. 3. c. 68., and 49 Geo. 3. c. 98.

WOAD, (GER. *Waid*. DU. *Weede*. DA. *Vede*. SW. *Vejde*. FR. *Pastel*, *Guède*, *Vouède*. IT. *Guadone*, *Guado*, *Glastro*. SP. *Pastel*, *Glasto*. PORT. *Pastel*. RUS. *Liet-*

njak. POL. *Sinilo*, *Urzet*. LAT. *Guadum*, (*Gladium*,) a plant with long green leaves, the lower ones narrow at both ends; those which grow upon the stalk broad at bottom, like the head of an arrow. On the tops come forth numerous yellow flowers, which are followed by little flat pods, containing the seeds. It grows wild in some parts of France, and on the coasts of the Baltic sea; the wild woad, and that which is cultivated for the use of the dyers, appear to be the same species of plant.

The preparation of woad for dyeing, is this: The plant puts forth at first five or six upright leaves, about a foot long, and six inches broad; when these hang downwards, and turn yellow, they are fit for gathering, and five crops may be gathered in one year.

The leaves are carried directly to a mill, much resembling the oil, or tan, mills, and ground into a smooth paste. If this process was deferred for some time, they would putrify, and send forth an insufferable stench. The paste is laid in heaps, pressed close and smooth, and the blackish crust, which forms on the outside, reunited if it happens to crack. After lying for fifteen days, the heaps are opened, the crust rubbed and mixed with the inside, and the matter formed into oval balls, which are pressed close and solid in wooden moulds. These are dried upon hurdles; they turn black on the outside, if in the sun, if in a close place yellowish, especially if the weather be rainy. The dealers in this commodity prefer the first. The good balls are distinguished by their being weighty, of an agreeable smell, and when rubbed of a violet-colour within. Woad affords a lasting and substantial blue in dyeing. See DYEING. It is cultivated in France, Spain, Portugal, the Azores, the Canaries, Switzerland, Sweden, Germany, and England. But it exhausts the land more than any other crop, and therefore is only grown on the fat soil of low grounds, such as the fens of Lincolnshire.

WOOD, is that solid and compact substance which constitutes the bulk of the trunk and branches of trees. When cut transversely, this wood is found to consist of numerous concentric layers, very distinct in some trees, especially those of cold climates. A different degree of hardness, and in some trees a prodigious difference of colour, obtains between the different concentric layers. Those nearest to the centre are the hardest, and generally go to compose what is called "the heart" of the timber; those nearer the exterior, and which are softer, are called "the sap." The layer which forms the line of discrimination, is more strongly marked in some species of wood than in others, but is more, or less, observable in all. Those who use wood for mechanical purposes, are fully aware of the great difference in these different parts, and of the precise line of discrimination. The

softer external layers have as little durability as hardness, compared with the heart or internal layers. They retain, indeed, more of the vital principle, as they retain the peculiar juices of the plant in a fluctuating state, liable to be acted upon by external causes, and scarcely united in a fixed state to the solid body of the wood. This sap is not limited to any determinate period of age, nor even to any determinate series of concentric circles of any individual tree; but differs according to the vigour of the plant, to the climate, to the rapidity of growth, and to a great variety of causes.

A remarkable difference, in point of solidity, exists between even the hardest portions of different trees. The specific gravity of some is so great, as for the wood to sink in water. Such is the iron-wood of China. Some is so light, that it is difficult of immersion, even by force, as in the instance of cork-wood.

For further information respecting the mechanical, and commercial, applications of wood, in order to avoid tautology, we must refer the reader to the generic title *TIMBER*, as well as to the names of each particular species of tree respectively, and to title *DYEING*, for an account of some species of wood used in that process.

WOOD, *staining of*. See *STAINING*.

WOODS, in the aggregate, of British growth, as well in their incipient state of poles, saplings, underwood, or by whatever appellation known, as in every subsequent period of their growth, are protected by a prodigious number of penal statutes. The 6 Geo. 1. c. 48., enlarged by 13 Geo. 3. c. 35., has laid down the line of discrimination between *timber*, and the other denominations of trees; subject to which, the wilful destruction of every species, from quicksets to oaks, are subjected to some kind of heavy punishment or other. See 2 *Dick. Pract. Expos.* 1082.

The importation of wood, of foreign growth, is under the regulations of the customs, and subject to prohibitions, restrictions, and duties respectively, according to the countries from which they are imported. By 51 Geo. 3. c. 45. and 95., and by 53 Geo. 3. c. 105., certain drawbacks are allowed on fir timber imported, and used in the mines of Devon and Cornwall.

WOOF, among manufacturers, the threads which the weavers shoot across with an instrument called the shuttle. The woof is of different matter, according to the piece to be wrought. In taffety, both woof and warp are silk. In mohairs, the woof is usually wool, and the warp silk. In satins, the warp is frequently flax, and the woof silk.

WOOL, (GER. *Wolle*. DU. *Wol*. DA. *Uld*. SW. *Ull*. FR. *Laine*. IT. and SP. *Lana*. PORT. *Lã*, *Lãa*. RUS. *Wolna*, *Scherst*. POL. *Wetna*. LAT. *Lana*,) a kind of long, soft, curly hair, which covers the skins of

several of the ruminating animals, but which is particularly cut or shorn from that of the sheep.

The principal differences in wool consist in the length, and fineness, of its filaments. That which has the finest filaments is reserved for fine cloths. The most beautiful European wools are those of Spain and Saxony; at least so they have been esteemed; but it is now said that the highland wool of Scotland, and that of the Shetland islands, are equal in quality to these. The breed of Merino, or fine-woolled Spanish sheep, has been introduced into this country, and found to retain the excellent qualities of the fleece. It has likewise been crossed with our own breeds with advantage, so that we may hope to become independent of Spain for fine wool. This event is likely too to be accelerated by a very recent discovery, which is, that our new colony of New South Wales, and probably, therefore, the whole of Australasia, will produce as fine wool as any in Europe.

Simple inspection may easily lead to error respecting the fineness of wool, which it is important the manufacturer should know with accuracy; and there is a method of attaining this accuracy, by employing a micrometer for comparing, by means of a microscope, the fineness of the wool to be examined with that of other wools chosen as standards, a method long practised in the east coast of Scotland, to discover the fineness of cloth: it is called a *weaver's glass*.

Though the long wool is not so fine as the Spanish, and cannot be employed for fine cloths, it is still very useful for a variety of fabrics; and as the sheep which produce it have much larger fleeces, the profit they bring is not inferior to that of the fine-woolled sheep; besides, the cloths made of their wool, being cheaper, have a much more extensive sale. The prosperous state of the woollen manufactures of England is partly owing to our abundance of this wool. But the breed of sheep which produces one, or the other, kind of wool is connected with the nature of their pasture, which ought to determine the choice of them.

Wool is naturally covered with a kind of grease, which preserves it from moths. Reaumur has observed, that a stuff may be preserved from these insects by rubbing it with greasy wool. Hence wool is not scoured till it is about to be dyed or spun.

In order to scour wool, it is put for about a quarter of an hour into a kettle, containing a sufficient quantity of water, mixed with a fourth of putrid urine, heated to such a degree as the hand can just bear, and it is stirred from time to time with sticks; it is then taken out and put to drain; it is next carried in a large basket to a stream of running water, where it is moved about till the grease is entirely separated, and no

longer renders the water turbid; it is then taken out and left to drain. It sometimes loses in this operation more than a fifth of its weight. The scouring should be carefully performed, because the wool is thereby better fitted to receive the dye.

WOOL, either in a raw or manufactured state, has always been the principal of the staple articles of this country. The price of wool was in very early times much higher in proportion to the wages of labour, the rent of land, and the price of butcher's meat, than at present. It was before the time of Edward III. always exported raw, the art of working it into cloth and dyeing being so imperfectly known, that persons above the degree of working people could not go dressed in cloth of English manufacture.

The first steps taken to encourage the manufacture of woollen cloths was by Edward III. who procured some good workmen from the Netherlands by means of protection and encouragement. The value of wool was considered of so much importance, that taxes were voted in that commodity, reckoning by the number of sacks; and in proportion to the price of the necessaries of life and value of silver, wool was at least three times dearer then than it is now. The manufacturing of cloth being once introduced into the country, the policy of preventing the exportation of the raw material was soon evident, and the first act was that of Hen. IV. c. 2., by which the exportation of sheep, lambs, or rams, is forbidden under very heavy penalties: these, and severer prohibitions, were also made use of to secure to Spain her breed of Spanish sheep; but such narrow-minded and contemptible restrictions are fast wearing away.

By stat. 28 Geo. 3. all former statutes respecting the exportation of wool and sheep are repealed, and numerous restrictions were consolidated in that statute.

By this act, if any person shall send or receive any sheep on board any vessel, to be carried out of the kingdom, such vessel shall be forfeited, and the person so offending shall forfeit 3*l*. for every sheep, and suffer solitary imprisonment for three months. But wether-sheep by a licence from the collector of the customs, may be taken on board for the use of the ship's company; and every person who shall export any wool, or woollen articles slightly made up, so as easily to be reduced again to wool, or any fuller's earth or tobacco-pipe-clay, and every carrier, ship-owner, commander, mariner, or other person, who shall knowingly assist in exporting, or attempting to export, these articles, shall forfeit three shillings for every pound weight, or the sum of 50*l*. in the whole, at the election of the prosecutor, and shall also suffer solitary imprisonment for three months. But wool may be carried coastwise upon being duly entered, and security being given according to the directions of the statute, to

the officer of the port whence the same shall be conveyed; and the owners of sheep within five miles of the sea, and ten miles in Kent and Sussex, cannot remove the wool, without giving notice to the officer of the nearest port, as directed by the statute; but this part of the statute is repealed by 54 Geo. 3. c. 78.; and the part of the statute which requires a registry of wool sent coastwise, is repealed by 1 & 2 Geo. 4. c. 81. See further, respecting Wool and the WOOLLEN MANUFACTURE, 2 & 3 Dick. Pract. Expos. those titles. The laws relating to the stamping, &c. of woollen cloths in the West Riding of Yorkshire, are altered by 1 & 2 Geo. 4. c. 116.

WOOL-COMBERS. By 35 Geo. 3. c. 124. all those who have served an apprenticeship to the trade of a wool-comber, or who are by law entitled to exercise the same, and also their wives and children, may set up and exercise such trade, or any other trade or business they are apt and able for, in any town or place within this kingdom, without any molestation; nor shall they be removable from such place by the poor laws.

WORM-SEED, (GER. *Wurmsaamen*. Du. *Zeeverzaad*. DA. *Ornfrö*. Sw. *Maskfrö*. FR. *Sementine*. IT. *Santonico*. SP. *Semen contra*. PORT. *Semente contra vermes*. RUS. *Aleksanderskaja polün*. POL. *Piotun glistny*. LAT. *Semen contra*), a hot, bitter, drying kind of seed, often given to destroy worms in the human body. This seed is small, of a brownish colour, oblong figure, and a strong smell. It must be chosen new, greenish, of a sharp, bitter, aromatic taste, not a little disagreeable. It is brought to us from Aleppo, and is produced in Persia, about the frontiers of Muscovy.

WORSTED, a thread spun of wool that

has been combed, and which, in the spinning, is twisted harder than ordinarily. It is chiefly used either to be knit or woven into stockings, caps, gloves, &c. Worsted has obtained its name from *Worstead*, a market-town in Norfolk, where the manufacture of this article was first introduced.

WORT, the infusion of malt, before it is made into beer by fermentation. See BREWING.

WORTHY, Sea. See SEA-WORTHY.

WRECK, such goods as after a shipwreck are cast upon the land by the sea, and left there within some county; for they are not wrecks so long as they remain at sea, being within the jurisdiction of the admiralty.

Various statutes have been made relative to wreck, which was formerly a perquisite belonging to the king, or by special grant to the lord of the manor; it is now, however, held, that if proof can be made of the property of any of the goods or lading which come to shore, they shall not be forfeited as wreck. The last statutes on the subject are 49 Geo. 3. c. 122., and 53 Geo. 3. c. 87., the latter being only an extension and amendment of the former. By these, cases of wreck are brought completely under the cognizance and protection of justices of the peace residing near the place, who are enabled to determine all matters respecting salvage, remuneration, sale of perishable goods, &c. &c. much to the furtherance of justice, and the interests of parties.

WRITING PAPER. (GER. *Schreibpapier*. Du. *Schryfpapier*. DA. *Skrivpapier*. Sw. *Skrifpapper*. FR. *Papier à écrire*. IT. *Carta da scrivere*. SP. *Papel para escribir*. PORT. *Papel para escrever*. RUS. *Pischtschaja bumaga*. POL. *Papier, do pisania*. LAT. *Charta scriptoria*.) See PAPER.

X

X Y L

X, THE twenty-second letter of our alphabet. In numerals it expresses 10, whence in the old Roman manuscripts it is used for denarius: and as such seems to be made of two V's placed one over the other. When a dash is added over it, thus, $\bar{X}$, it

signifies ten thousand; and when laid flat, thus, $\times$, signifies one thousand.

XYLO-ALOE, in pharmacy, the aloes wood, or lignum-aloes. See ALOES.

XYLO-BALSAMUM, the wood of the tree which bears the balm of Gilead.

Y A C

Y A R

Y, THE twenty-third letter of our alphabet. Y is a numeral, signifying 150, or according to Baronius, 159; and with a dash at top, as $\bar{Y}$, it signifies 150,000.

YACHT, is a small ship, with one deck, carrying four, eight, or twelve guns, and thirty or forty men. Yachts, in general, are 1009

from 30 to 160 tons; contrived and adorned both within and without, for carrying state passengers. They answer the purposes of business, as well as pleasure, being very fast sailers.

YARD, a long measure used in England, and Spain, chiefly to measure cloths,

stuffs, &c. The English yard contains three feet, or thirty-six inches, and was so settled by Henry I. from the length of his own arm. See MEASURE.

YARDS, of a Ship, are those long pieces of timber which are made a little tapering at each end, and are fitted each athwart its proper mast, with the sails made fast to them, so as to be hoisted up, or lowered down, as occasion serves. They have the names from the masts to which they belong. The length of the main yard is, usually, five-sixths of the length of the keel, or six-sevenths of the length of the main-mast. Their thickness is, usually, three-quarters of an inch for every yard in length. The length of the main-top-yard is two-fifths of the main-yard; and the fore-yard four-fifths of it. The sprit-sail-yard, and cross-jack-yard, are half the mizen-yard; and the thickness of the mizen-yard and sprit-sail-yard is half an inch for every yard in length. All small yards are half the great yards, from cleat to cleat. When a yard is down a portlast, it gives the length of all top-sail-sheets, lifts, ties, and bunt-lines, as also of the leech-lines, and halliards, measuring from the hounds to the deck; and when it is hoisted, it gives the length of the clew-lines, clew-garnets, braces, tackles, sheets, and bow-lines. There are several sea-terms relating to the management of the yards, as, square the yards; that is, see that they hang right across the ship, and no yard-arm traversed more than another: top the yards, that is, make them stand even. To top the main, and fore, yards, the clew-lines are the most proper; but when the top-sails are stowed, then the top-sail sheets will top them.

YARD-ARM is that half of the yard that is on either side of the mast, when it lies athwart the ship.

YARN, (GER. *Garn*. DU. *Garen*. DA. and Sw. *Garn*. FR. *Fil*. IT. *Filato*. SP. *Hilo*. PORT. *Fio*. RUS. *Prasha*. POL. *Przedza*.) wool, or flax, spun into thread, of which they weave cloth. Yarn is ordered after the following manner: after it has been spun upon spindles, spools, or the like, they reel it upon reels, which are hardly two feet in length, and have but two contrary cross-bars, being the best, and the least liable to ravelling. In reeling of fine yarn, the better to keep it from ravelling, you must, as it is reeled, with a tie-band of big twist, divide the slipping or skain into several leys, allowing to every ley eighty threads, and twenty leys to every slipping, if the yarn is fine; otherwise less of both kinds. The yarn being spun, reeled, and in the slippings, the next thing is to scour it. In order to fetch out the spots, it should be laid in luke-warm water for three or four days, each day shifting it once, wringing it out, and laying it in another water of the same nature; then carrying it to a well or brook, and rinsing it till nothing comes from

it but pure clean water: that done, take a bucking-tub, and cover the bottom with very fine aspen ashes; and then having opened and spread the slippings, lay them on those ashes, and put more ashes above, and lay in more slippings, covering them with ashes as before; and thus lay one upon another, till the yarn is put in; afterwards cover up the uppermost yarn with a bucking-cloth, and, in proportion to the size of the tub, lay in it a peck or two more of ashes: this done, pour upon the uppermost cloth a great deal of warm water, till the tub can receive no more, and let it stand so all night. Next morning you are to set a kettle of clean water on the fire; and when it is warm, pull out the spiggot of the bucking-tub, to let the water run out of it, into another clean vessel; as the bucking-tub wastes, fill it up again with warm water on the fire; and as the water on the fire wastes, so likewise fill up that with the ley that comes from the bucking-tub, ever observing to make the ley hotter and hotter, till it boils: then you must, as before, ply it with the boiling ley at least four hours together, which is called "the driving of a buck of yarn." This being done, for the whitening of it, you must take off the bucking-cloth; then putting the yarn with the ley-ashes into large tubs, with your hands labour the yarn, ashes, and ley, pretty well together, afterwards carry it to a well, or river, and rinse it clean; then hang it upon poles in the air all day, and in the evening take the slippings down, and lay them in water all night; the next day hang them up again, and throw water upon them as they dry, observing to turn that side outermost which whitens slowest. After having done this for a week together, put all the yarn again into a bucking-tub, without ashes, covering it as before with a bucking-cloth; lay thereon good store of fresh ashes, and drive that buck, as before, with very strong boiling ley, for half a day, or more; then take it out, and rinse it, hanging it up, as before, in the day-time, to dry, and laying it in water at night another week. Lastly, wash it over in fair water, and so dry it up. Your yarn being thus scoured and whitened, wind it up into moderate-sized balls.

YAWL, a small ship's boat, common in Norway.

YEAST, YEST, BARM, or LEAVEN, is the mucilaginous froth which rises to the surface of beer in the first stage of its fermentation. It has the power of exciting fermentation in a variety of bodies, and by this means of generating a similar substance in considerable quantity.

Mr. Harry has published a method of preparing artificial yeast, by which good bread may be made without the assistance of any other ferment. Boil flower and water together to the consistence of treacle, and when the mixture is cold, saturate it with

fixed air. Pour this mixture into one or more large bottles, or narrow-mouthed jars: cover it over loosely with paper, and upon that lay a slate, or board, with a weight, to keep it steady. Place the vessel in a situation where the thermometer will stand from 70 to 80 degrees, and stir up the mixture two or three times in 24 hours. In about two days such a degree of fermentation will have taken place, as to give the mixture the appearance of yeast. With the yeast in this state, and before it has acquired a thoroughly vinous smell, mix the quantity of flour intended for bread, in the proportion of six pounds of flour to a quart of the yeast, and a sufficient quantity of warm water. Knead them well together in a proper vessel, and covering it with a cloth, let the dough stand for 12 hours, or till it appears to be sufficiently fermented in the before-mentioned degree of heat. It is then to be formed into loaves, and baked. Mr. Harry adds, that perhaps the yeast would be more perfect if a decoction of malt were used instead of simple water.

It has lately been discovered, that a decoction of malt alone, without any addition, will produce a yeast proper enough for the purpose of brewing. This discovery was made by Joseph Senyor, a servant of the Reverend Mr. Mason, of Aston, near Rotherham; and he received for it a reward of 20*l*. from the Society of Arts. The process is as follows:

Procure three earthen or wooden vessels of different sizes, and apertures; one capable of holding two quarts, the other three or four, and the third five or six. Boil a quarter of a peck of malt for about eight or ten minutes in three pints of water; and when a quart is poured off from the grains, let it stand in the first or smaller vessel in a cool place till not quite cold, but retaining that degree of heat which the brewers find to be proper when they begin to work their liquor. Then remove the vessel into some warm situation near a fire, where the thermometer stands between 70 and 80 degrees, and there let it remain till the fermentation begins,

which will be perceived within 30 hours. Add then two quarts more of a like decoction of malt, when cool, as the first was; and mix the whole in the second or larger vessel, and stir it well in, which must be repeated in the usual way, as it rises in a common vat: then add a still greater quantity of the same decoction, to be worked in the larger vessel, which will produce yeast enough for a brewing of 40 gallons.

Common ale-yeast may be kept fresh, and fit for use, several months by the following method:—Put a quantity of it into a close canvass bag, and gently squeeze out the moisture in a screw-press, till the remaining matter be as firm and stiff as clay. In this state it may be close packed up in a tight cask for securing it from the air, and will keep fresh, and fit for use for a long time.

YELLOW. See **DYEING**, **PAINTING**, and **COLOURS**.

YELLOW BERRIES. (GER. *Französische oder, Fransche beerer, Gelbe beeren.* Du. *Geele Bessen.* DA. and Sw. *Avignons-frü.* FR. *Graines d'Avignon, Graine jaune, Grainette.* IT. *Coccole di Spincervino.* SP. *Grana de Avinon.* PORT. *Graos de Avinho.* POL. *Szeklak.*) See **FRENCH BERRIES**.

YELLOW-LEAD. See **MASSICOT**.

YELLOW-WEED. See **WELD**.

YEW. The yew-tree is a native of Britain, France, Switzerland, &c. and of North America. The wood is reddish, full of veins, and flexible, very hard, and smooth, and almost incorruptible. Its hardness renders it very proper for turners and cabinet-makers. Its berries are often eaten by birds, and are therefore not poisonous to them; but it is a common opinion that the leaves are poisonous to cattle, and many instances of this effect on cattle of different descriptions have been well ascertained. It is of no great height, but the trunk grows to a large size. Mr. Pennant has taken notice of a very remarkable decayed one in Fortingal church-yard, the remains of which measured fifty-six feet and a half in circumference.

Z

Z, THE twenty-fourth and last letter of our alphabet. As a numeral letter it stood for 2000, when a dash was added at top, thus, $\overline{Z}$, stood for 2000 times 2000. In abbreviations this letter formerly stood as a mark for several sorts of weights; sometimes it signified an ounce and a half, and very frequently it stood for half an ounce, or a

Z A C

dram troy weight; and it has in earlier times been used to express the third part of an ounce, or eight scruples. **Z Z** were used by some of the ancient physicians to express myrrh, and at present they are often used to signify *zinziber*, or ginger.

ZACUES, a silver Persian money, being half a mamoudi. See **MAMOUDI**.

ZAFFRE is the oxyde of cobalt, employed in painting pottery-ware and cobalt of a blue colour. See **COBALT**.

ZEA, *Indian Corn*. The only species, the mays, or maize. The Indians in New England, and many other parts of America, had no other vegetable but maize or Indian corn for making their bread; they call it *weachin*: and in the United States of America there is much of the bread of the country made of this grain, not of European corn. In Italy, Germany, Spain, and Portugal, maize constitutes a great part of the food of the poor inhabitants. The ear of the maize yields a much greater quantity of grain, than any of our corn-ears. There are commonly about eight rows of grain in the ear, often more if the ground is good. Each of these rows contains at least 30 grains, and each of these gives much more flour than a grain of any of our corn. The grains are usually either white or yellow; but sometimes they are red, bluish, greenish, or olive-coloured, and sometimes striped and variegated. This sort of grain, though so essentially necessary to the natives of the place, is yet liable to many accidents. It does not ripen till the end of September; so that the rains often fall heavily upon it while on the stalk, and the birds in general peck it when it is soft and unripe. Nature has, to defend it from these accidents, covered it with a thick husk, which keeps off slight rains very well; but the birds, if not frightened away, often eat through it, and devour a great quantity of corn. For other particulars relative to the plant, see **MAIZE**, and **INDIAN CORN**.

ZEALAND, NEW, a part of that newly-appropriated part of the terraqueous globe, distinguished under the title of Australasia. It consists of two large islands, separated by only a narrow channel, and but a few leagues distant from that part of New Holland which the British have settled under the name of New South Wales. Its principal indigenous production is flax of the finest quality; but most of the vegetable productions of Europe and America thrive well, and yield abundantly. Potatoes succeed beyond all competition. The shores abound in fish of various kinds, and on the whole, it should seem to be a country holding out no small invitations to future colonization.

ZECHIN, a Venetian gold coin, worth about 9s. sterling.

ZEDOARY, (GER. *Zütwur*. DU. *Zedoar*. DA. *Zilverrod*. SW. *Silfärsrot*. FR. *Zédoaire*. IT. *Zedoaria*, *Zettovario*. SP. *Cedoaria*, *Zedoaria*. PORT. and LAT. *Zedoaria*.) is a medicinal root brought to us from China. It should be chosen fresh, sound, and hard, in large pieces, it matters not whether long, or round, in its form; of a smooth surface, and of the briskest smell possible; such as is friable, dusty, and worm-

eaten, is to be rejected. Zedoary, distilled with common water, affords a thick and dense essential oil, on which its virtues principally depend, which soon concretes into a kind of camphire. It is a sudorific, and is used as a cordial medicine.

ZEST, the woody thick skin, quartering the kernel of a walnut. Zest is also used for a chip of orange or lemon-peel; such as is usually squeezed into ale, wine, &c. to give a flavour; or the fine ethereal oil which spurts out of that peel on squeezing it.

ZINC, (GER. *Du. Da. and Sw. Zink*. FR. *Zinc*. IT. *Zinco*. SP. *Zinco*, *Cinck*. PORT. *Zinco*. RUS. *Schpiäuter*. POL. *Cybec*. LAT. *Zincum*.) a metal called also *spelter*; it has never been found in Europe in a state of purity, and it was long before a method was discovered of extracting it from its ore. Henkel pointed out one in 1721; Von Swab obtained it by distillation in 1742; and Margraf published a process in the Berlin Memoirs, in 1746.

Zinc is of a brilliant white colour, with a shade of blue, and is composed of a number of thin plates adhering together. When this metal is rubbed for some time between the fingers, they acquire a peculiar taste, and emit a very perceptible smell. Its hardness is 6.5. When rubbed upon the fingers, it tinges them of a black colour. Its specific gravity, after it has been melted, is 6.861; after it has been compressed, 7.1908; so that its density is increased 1-20th. This metal forms, in a manner, the limit between the brittle and the malleable metals. Its malleability is by no means to be compared with that of some of the metals; yet it is not brittle like others. When struck with a hammer it does not break, but yields, and becomes somewhat flatter; and by a cautious and equal pressure, it may be reduced to pretty thin plates, which are supple and elastic, but cannot be folded without breaking. When heated to about 400°, it becomes so brittle that it may be reduced to powder in a mortar. It is not ductile; its tenacity has not been ascertained. When heated to the temperature of about 700°, it melts; and if the heat is increased, it evaporates, and may be easily distilled over close vessels. When allowed to cool slowly, it crystallises in small bundles of quadrangular prisms, disposed in all directions. If they are exposed to the air while hot, they assume a blue changeable colour. In this case its lustre is soon tarnished, but it scarcely undergoes any other change. When kept under water its surface soon becomes black, the water is slowly decomposed, hydrogen gas is emitted, and the oxygen combines with the metal. If the heat is increased, the decomposition goes on more rapidly; and if the steam of water is made to pass over zinc at a very high temperature, it is decomposed so rapidly, that very violent detonations take place. When zinc is kept melted in an open

vessel, its surface is soon covered with a grey-coloured pellicle, in consequence of its combination with oxygen. When this pellicle is removed, another soon succeeds it; and in this manner may the whole of the zinc be oxidated. When these pellicles are heated and agitated in an open vessel, they soon assume the form of a grey powder, often having a shade of yellow. The powder has been called the grey oxide of zinc. When zinc is raised to a strong red heat in an open vessel, it takes fire and burns with a brilliant white flame, and, at the same time, emits a vast quantity of very light white flakes. These are merely an oxide of zinc.

Zinc combines with almost all the metals, and some of its alloys are of great importance. It may be united to gold in any proportion by fusion. The alloy is the whiter, and the more brittle, the greater quantity of zinc it contains. An alloy, consisting of equal parts of these metals, is very hard and white, receives a fine polish, and does not tarnish readily. It has therefore been proposed by Mr. Malouin, as very proper for the specula of telescopes. One part of zinc is said to destroy the ductility of 100 parts of gold.

Platinum combines very readily with zinc. The alloy is brittle, pretty hard, very fusible, of a bluish-white colour, and not so clear as that of zinc.

The alloy of silver and zinc is easily produced by fusion. It is brittle, and has not been applied to any use.

Zinc may be combined with mercury, either by triturating the two metals together, or by dropping mercury into melted zinc.

This amalgam is solid. It crystallises when melted, and cooled slowly, into lamellated hexagonal figures, with cavities between them. They are composed of one part of zinc, and two and a half of mercury. It is used to rub on electrical machines, in order to excite electricity.

Zinc combines readily with copper, and forms one of the most useful of all the metallic alloys. The metals are usually combined together by stratifying plates of copper, and a native oxide of zinc, combined with carbonic acid, called calamine, and applying heat. When the zinc does not exceed a fourth part of the copper, the alloy is known by the name of brass. It is of a beautiful yellow colour, more fusible than copper, and not so apt to tarnish. It is malleable, and not so ductile, that it may be drawn out into wire. Its density is greater than the mean. It has been calculated at 7.6296, but it actually is 8.3958; so that its density is increased by about one-tenth.

When the alloy contains three parts of zinc, and four of copper, it assumes a colour nearly the same with gold; but it is not so malleable as brass. It is then called pinchbeck, prince's metal, or prince Rupert's me-

tal. Brass was known, and very much valued, by the ancients. They used an ore of zinc to form it, which they called *cadima*. Dr. Watson has proved that it was to brass that they gave the name of *orichalcum*. Their *æs* was copper, or rather bronze. It is very difficult to form an alloy of iron and zinc. Wallerius has shown, that iron is capable of combining with a small portion of zinc; and Malouin has shown, that zinc may be used instead of tin to cover iron plates, — a proof that there is an affinity between the two metals.

Tin and zinc may be easily combined by fusion. The alloy is much harder than zinc, and scarcely less ductile. This alloy is often the principal ingredient in the compound called pewter.

The alloy of lead and zinc has been examined by several chemists; Gmelin succeeded in forming the alloy by fusion. He put some suet into the mixture, and covered the crucible, in order to prevent the evaporation of the zinc. When the zinc exceeded the lead very much, the alloy was malleable, and much harder than lead. A mixture of two parts of zinc, and one of lead, formed an alloy more ductile and harder than the last. A mixture of equal parts of zinc and lead, formed an alloy differing little in ductility and colour from lead; but it was harder and more susceptible of polish, and more sonorous. When the mixture contained a smaller quantity of zinc, it still approached nearer the ductility and colour of lead; but it continued harder, more sonorous, and susceptible of polish, till the proportion approached to one of zinc, and sixteen of lead, when the alloy differed from the last metal only in being somewhat harder.

ZIRCON, a stone brought from Ceylon, and found also in France and Spain, and other parts of Europe. The texture of zircon is foliated. Fracture imperfectly conchoidal. Causes a very great double refraction. Specific gravity from 4.615 to 4.583. Colours various, commonly reddish or yellowish, sometimes clear. Before the blowpipe it loses its colour, but not its transparency. With borax, it melts into a transparent glass. Infusible with fixed alkali and microcosmic salt.

1. The variety formerly called hyacinth, is of a yellowish-red colour, mixed with brown. Its surface is smooth. Its lustre 3. Its transparency 3 to 4.

2. The variety formerly called jargon of Ceylon is either grey, greenish, yellowish-brown, reddish-brown, or violet. It has little external lustre. It is sometimes nearly opaque.

ZOPISSA, naval pitch, or that scraped from the sides of ships that have been a long time at sea. It is a composition of pitch and tar, impregnated by salt water; and is used in external applications as resolute and desiccative.

APPENDIX.

CONTENTS OF THE APPENDIX.

- No. I. The Monies of the World, with their respective value in British Sterling.
 II. Catalogue of Trades and Occupations.
 III. Abstract of an Act for the Repeal of the several Duties of Customs imposed
 by divers preceding Statutes; and for granting other Duties in lieu thereof,
 being the 59 Geo. 3. c. 52.
 IV. Tables of Package, Scavage, Bailage, and Portage Duties, payable by Aliens
 at the Port of London.
 V. London Port or Dock Duty.
 VI. Quarantine Duty.
 VII. A Table of the Duties payable on Goods and Vessels arriving from any Place
 within the Limits of the sole and exclusive Trade heretofore granted to the
 South Sea Company.
 VIII. A Table of the Drawbacks of Customs and Excise allowable on the Exportation
 of Goods, Wares, and Merchandise, on which the Import Duties have
 been paid.
 IX. A Table of Bounties and Allowances on British Goods, Wares, and Merchandise
 exported, and of Repayments of Duty on articles used or consumed
 in Great Britain.

APPENDIX, No. I.

THE MONIES OF THE WORLD

WITH THEIR RESPECTIVE VALUE IN BRITISH STERLING

N. B. That c stands for Copper; s for Silver; g for Gold; and thus marked *, are imaginary, as the Pound Sterling of England.

APPENDIX, No. II.

CATALOGUE OF TRADES AND OCCUPATIONS.

The following is a Catalogue of such Trades and Occupations as are ordinarily followed in the Metropolis, and other large cities of Great Britain, with an averaged estimate of the Capitals required to commence the exercise of them respectively.

The reader of discernment will appreciate such an attempt by the utility of its general design, rather than by the actual precision of its execution in every particular instance; because he must immediately perceive that no rules can be laid down on such a subject, which do not necessarily involve numerous exceptions: those, however, may be reasonably considered as cases out of the *ordinary course*, to which alone the Editor of a work for the *ordinary purposes* of life ought to confine himself. If a mere existence be sought by the young beginner, his object, at least in all the inferior trades, may probably be obtained with a smaller capital than is insisted on in this representation; if a *debut* of splendour and celebrity be his pursuit, the requisite means can only be limited by the extent and magnitude of his purpose. At all events, it must be observed that the account here exhibited refers solely to the capitals required for *establishing* tradesmen, and does not involve the intricate considerations of long credit, probable losses, and other concomitant liabilities incident to the subsequent continuance and pursuit of the numerous trades here exemplified.

	£.	£.
Anchorsmith	250 to	500
Agriculturist (generally)	1000 to	3000
Accountant and Arbitrator	200 to	300
Appraiser and Furniture Broker	150 to	300
Auctioneer and Appraiser	250 to	1000
Accoutrement and Belt Maker, or Girdler	150 to	500
Agent, Army	1000 to	2000

APPENDIX, No. III.

ABSTRACT OF AN ACT

FOR

THE REPEAL OF THE SEVERAL DUTIES OF CUSTOMS

IMPOSED BY DIVERS PRECEDING STATUTES.

AND FOR

GRANTING OTHER DUTIES IN LIEU THEREOF,

Being the 59 Geo. 3. c. 52.

IT recites, First, that an act was made in the forty-ninth year of his present majesty's reign, for repealing the several duties of customs chargeable in Great Britain, and for granting in lieu thereof, certain other duties of customs and certain drawbacks in respect thereof.

Secondly, that by an act made in the 54th year of his present majesty's reign, certain duties of customs were imposed on goods, wares, and merchandise imported into Great Britain from any port or place within the limits of the charter granted to the united company of merchants of England trading to the East Indies.

Thirdly, that several new and additional duties of customs have from time to time been granted and made payable in Great Britain by several acts made since the making of the said recited acts.

Fourthly, that it is expedient that the several duties of customs now payable in Great Britain should be consolidated, and that for that purpose all duties of customs now payable in Great Britain should cease and determine, and that other duties of customs should be granted and made payable in lieu thereof, with the following exceptions, viz.

1st, So far as shall relate to the recovering, allowing, or paying any arrears of duties and drawbacks respectively, which may remain unpaid or not allowed on the 5th of July 1819, and all fines, penalties, or forfeitures relating thereto respectively, which shall have been incurred at any time on or before the said 5th of July.

2dly, The duties of package, scavage, baillage, or portage, and all other duties payable to the mayor and commonalty and citizens of the city of London, or to the lord mayor of the said city for the time being, or to any other city or town corporate within

Great Britain, or any other special privilege or exemption to which any person or persons, or body or bodies politic or corporate, within Great Britain, is or are now entitled by law.

3dly, The duties on ships or vessels according to the tonnage thereof, granted and imposed by an act passed in the 39th year of the reign of his present majesty, for better regulating the port of London, and any act or acts for amending the same, or any of the duties granted and imposed by an act passed in the 45th year of the reign of his present majesty, for the more effectual performance of quarantine, and any act or acts for amending the same.

4thly, The duties on goods, wares, and merchandise imported, and on ships or vessels according to the tonnage thereof, granted and imposed by an act passed in the 55th year of the reign of his present majesty, as an indemnity to the South Sea Company for certain privileges of which they were deprived by that act, and of any act or acts for amending the same.

5thly, The provisions contained in two acts for the union of Great Britain and Ireland, the one made in the parliament of Great Britain, in the 39th and 40th years of his present majesty's reign, and the other made in the parliament of Ireland in the 40th year of his present majesty's reign, or in any other act or acts in force on or immediately before the said 5th of July 1819, by which any goods, wares or merchandise, the growth, produce, or manufacture of Ireland, imported into Great Britain from Ireland, or any goods, wares, or merchandise, the growth, produce, or manufacture of Great Britain, exported from Great Britain to Ireland, are respectively made liable to or are charged with or exempted from any duties of customs, whether countervailing or others,

or by which any drawbacks are allowed or given on the exportation of such goods, wares, or merchandise.

It then enacted, That from and after the 5th of July 1819, in lieu and instead of the subsidies and duties of customs hereby made to cease and determine, there shall be raised, levied, collected, and paid unto his majesty, his heirs and successors, in ready money, (except as hereinafter is provided,) without any discount whatever, upon goods, wares, and merchandise imported or brought into Great Britain, the several duties of customs as the same are respectively inserted, described, and set forth in figures in the tables to this act annexed, marked A. and B., and upon goods, wares, and merchandise exported from Great Britain, the several duties of customs as the same are respectively inserted, described, and set forth in figures in the table to this act annexed marked C., and upon goods, wares, and merchandise brought or carried coastwise from one port or place in Great Britain to any other port or place within Great Britain, the several duties of customs as the same are respectively inserted, described, and set forth in figures in the table to this act annexed marked D.; and upon ships or vessels, according to the tonnage thereof, entering inwards or outwards in any port of Great Britain from or to foreign parts, the several duties of customs as the same are respectively inserted, described, and set forth in figures in the table hereunto annexed marked E.; and that there shall also be paid or allowed the several drawbacks of the several duties of customs as the same are also respectively inserted, described, and set forth in figures in the said tables A. B. and D.; any law, custom, or usage to the contrary notwithstanding. And that such of the duties and drawbacks of customs by this act imposed, as shall arise in England and Scotland, shall be under the management of the commissioners of England and Scotland respectively, for the time being.

That from and after the said 5th of July 1819, all duties of customs and excise charged and paid on the importation into Great Britain of any foreign or colonial goods, wares, or merchandise, shall, on the exportation from Great Britain to Ireland of such goods, &c. be drawn back, and paid and allowed to the exporters of such goods, &c. subject to all such rules and regulations as are required by any act or acts in force in Great Britain immediately before the said 5th of July 1819.

That on the importation of any foreign goods, wares, or merchandise, into Great Britain, from Ireland, such import duty of customs shall be paid and payable as if such foreign goods, &c. had been imported from foreign parts, either directly from the place of their growth or produce, or not directly from such place, according as they were in

fact at first so imported from foreign parts into Ireland; and that for the purpose of ascertaining whether any such goods, &c. were first imported into Ireland directly from the place of their growth or produce, or not directly from such place, it shall be specified and set forth in every cocket or clearance of any such foreign goods, &c. exported from Ireland to Great Britain, whether such goods, &c. were first imported directly from the place of their growth or produce, or not directly from such place, and the import duty of customs on such goods, &c. shall be payable accordingly on such goods when imported into Great Britain from Ireland; and if it shall not be expressed and set forth in such cocket or clearance of such goods, &c. whether the same were so first imported into Ireland directly from the place of their growth or produce or not, then and in such case such goods, &c. shall be deemed liable to such duties of customs on their importation into Great Britain from Ireland, as if the same had been imported from foreign parts, not directly from the place of their growth or produce; any thing in any act or acts to the contrary notwithstanding.

That the duties imposed by this act upon the importation of BUCK WHEAT, inserted, described, and set forth in the Table marked A. shall continue and be in force until the 25th day of March, 1821, and no longer.

That the duty of 6s. 3d., specified in the Table marked A. on every 100lb. weight of COTTON WOOL, not being the produce of and directly imported from any British colony or plantation in America, shall continue and be in force until and upon the 5th day of July, 1822, and no longer; and that all cotton wool, and waste of cotton wool, being the produce of, but not imported directly from any British colony or plantation in America, and all cotton wool, and waste of cotton wool, the produce of any other country or place which shall be so imported on or before the 5th day of January, 1820, shall be subject and liable to the duties upon every 100lb. weight thereof mentioned, specified, and set forth in the Tables marked A. and B.; and that all such cotton wool, and waste of cotton wool, which shall be so imported from and after the said 5th day of January, 1820, shall be subject to the duties in respect of the value thereof, mentioned, specified, and set forth in the said Tables marked A. and B.; provided always, that upon all cotton wool, or waste of cotton wool, which shall have been or shall be secured in warehouses without payment of duty at any time previous to the said 5th day of January, 1820, the duty of 8s. 7d. for every 100lb. weight thereof shall be charged and paid at any time, as well after as before the said 5th day of January, 1820, when such cotton wool shall be taken out of warehouse for home consumption.

That the duties imposed by this act, and specified, mentioned, and set forth in Table D., upon COALS or CULM brought or carried coastwise to any port or place within the principality of Wales, shall continue in force until the 1st of August, 1820, and no longer; and that *from and after* the said 1st of August, 1820, coals or culm brought or carried coastwise to any port or place within the said principality, shall be subject and liable to such and the like duties as coals or culm brought or carried coastwise into any port or place in England, except the port of London, are subject and liable to under this act, and the said Table D. thereto annexed, or shall be subject or liable to under any act in force, immediately before the said 1st of August, 1820.

That the duties on SUGAR imported, imposed by this act, and set forth in Tables A. and B., shall continue in force till the 25th of March, 1820, but no longer, and shall be accounted for according to 59 Geo. 3. c. 3.; a separate account of the same being kept at the several custom-houses.

That whenever it shall appear by notices in the *London Gazette*, that the average price of Brown or Muscovado SUGAR, of the British plantations, (ascertained, taken, and published in manner prescribed by law in Great Britain,) for any period required by law, shall be below *forty-nine* shillings the hundred weight, then and in such case it shall be lawful for the lord high treasurer, or the commissioners of his majesty's treasury, or any three of them for the time being, to suspend, until a new average shall be published in the said Gazette, according to law, the payment of *one* shilling in the hundred weight, part of the duty such sugar of the British plantations granted by this Act, and the Table marked A. thereto annexed; and the like sum of *one* shilling in the hundred weight, part of the duty of two pounds per hundred weight on sugar of the growth or produce of any place within the limits of the charter granted to the United Company of Merchants of England, trading to the East Indies, granted by this act, and the Table marked B. thereto annexed; and if such average price shall be below *forty-eight* shillings, then *two* shillings of the said duties respectively; and if such average price shall be below *forty-seven* shillings, then *three* shillings of such duties respectively; and to continue such suspension from time to time, if the case shall so require, according to the averages published as aforesaid.

And, that whenever it shall appear by notices, in like manner, that the average price of Brown or Muscovado Sugar, of the British plantations (ascertained and taken in like manner), for any period required by law, shall exceed *sixty* shillings the hundred weight, then and in such case, *one* shilling in the hundred weight, part of the duty of

two pounds per hundred weight on East India sugar, imposed by Table B. annexed to this act, shall be suspended until a notice of a new average price of such sugar shall be published in manner aforesaid; and if such average price shall exceed the sum of *sixty-one* shillings the hundred weight, then *two* shillings in the hundred weight, part of the said duty, shall be so suspended; and in like manner if such average price of such sugar shall exceed *sixty-two* shillings the hundred weight, then *three* shillings in the hundred weight of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-three* shillings the hundred weight, then *four* shillings of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-four* shillings the hundred weight, then *five* shillings of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-five* shillings the hundred weight, then *six* shillings of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-six* shillings the hundred weight, then *seven* shillings of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-seven* shillings the hundred weight, then *eight* shillings of the said duty shall be so suspended; if such average price of such sugar shall exceed *sixty-eight* shillings the hundred weight, then *nine* shillings of the said duty shall be so suspended; and if such average price of such sugar shall exceed *sixty-nine* shillings the hundred weight, then *ten* shillings, part of the said duty, shall be so suspended. Provided always, that nothing in this act, or any of the tables thereto annexed, shall extend to permit or allow any goods, wares, or merchandise whatever, to be imported into or exported from Great Britain in any way or manner contrary to any act or acts in force in Great Britain, on or immediately before the said 5th of July, 1819, except only so far as any such act or acts is expressly altered by this act, or in cases expressly provided for by this act; any duty, clause, or matter, in this act, or any of the tables thereto annexed, to the contrary notwithstanding.

That from and after the passing of this act, it shall not be lawful for the East India Company, or for any other person or persons, to expose any SILK HANDKERCHIEFS, of the manufacture of Persia, China, or the East Indies, to sale, for the purpose of being used or worn in Great Britain, and it shall not be lawful for the same to be used or worn in Great Britain, or to be sold or exposed to sale therein, but the same shall be subject to seizure and forfeiture, notwithstanding the 49 Geo. 3. c. 98., and the 55 Geo. 3. c. 93., by which acts the importation, on the payment of certain duties, and the sale and wearing of the same, were permitted; and the

person or persons who shall wear or use the same, or who shall sell or expose the same to sale, or shall have the same in his, her, or their custody or possession, shall be liable to such penalties and fines as if the said provisions in the said acts had never been had or made.

That from and after the said 5th of July, 1819, until the 25th of March, 1820, no duty of customs shall be charged or payable upon *SANTA MARIA WOOD*, fit for naval purposes, imported into Great Britain from the Bay of Honduras, in British-built vessels, owned, navigated, and registered according to law; any thing in this act, or any of the tables thereto annexed, to the contrary notwithstanding: provided that such wood shall be regularly entered and landed under the care of the proper officers of the customs. Nor upon any *TEAKE WOOD*, fit for naval purposes, of the growth or production of any British colony, plantation, territory, or possession in Africa; provided that due entry be made thereof, and that such wood be landed in the presence of the proper officer at the port of importation.

That foreign goods, wares, and merchandise, which have been regularly imported into Great Britain, and afterwards exported from thence, and then re-imported into Great Britain, shall be subject and liable to all such duties of customs as are by this act granted upon importation of such goods, wares, and merchandise. But that nothing in this act shall extend to compel the proprietors of goods, wares, or merchandise, to pay the duties upon the importation or landing thereof in Great Britain, in any case where such goods, &c. might on or immediately before the said 5th of July, 1819, have been warehoused or otherwise secured without payment of duty; or in any case where the whole or any part of the duties on such goods, &c. are permitted to be secured by bond or otherwise, by virtue of any act of parliament in force in Great Britain, on and immediately before the said 5th of July, 1819; but that in all such cases the duties specified in the tables to this act annexed, marked A. and B., may be secured by bond or otherwise, in such manner and under such rules, regulations, restrictions, and conditions, as are contained in any such act, except where it is otherwise provided by this act: provided always, that in case the importer or proprietor of any goods, &c. which shall have been lodged in warehouses, or otherwise secured by virtue of any act of parliament in force on or immediately before the said 5th of July, 1819, and on which the duties due on the importation thereof, shall not have been paid, shall be desirous of taking any such goods out of such warehouse, &c. for the purpose of being used or consumed in Great Britain; then and in such case the duties imposed by this act shall be payable thereon.

That in case the importer or proprietor of any *COTTON WOOL*, or waste of cotton wool, the produce of any British colony or plantation in America, not being imported directly from thence, or of any cotton wool, or waste of cotton wool, the produce of any other country or place, which shall have been secured in warehouses at any time on or before the 5th of January, 1820, and on which the duties shall not have been fully paid on or before the said 5th of January, 1820, shall be desirous of taking any such cotton wool, or waste of cotton wool, out of such warehouse after the 5th of January, 1820, for the purpose of being used or consumed in Great Britain, then and in such case the duties imposed by this act, and the Tables A. and B. thereto annexed, on cotton wool, or waste of cotton wool, according to the value thereof, shall be payable and paid on such cotton wool, &c. so taken out of warehouse, notwithstanding it may have been imported and warehoused on or before the said 5th of January, 1820.

That it shall and may be lawful for the commissioners of the customs in England and Scotland respectively, by and with the consent and approbation of the commissioners of his majesty's treasury, or any three of them, upon proof to the satisfaction of the said commissioners of the customs, that orders were given for the purchase of any *SHEEP'S WOOL*, or *LAMB'S WOOL*, at any time before the passing of this act, and that such sheep's wool, or lamb's wool, shall be imported into Great Britain at any time after the passing of this act, to admit such sheep's wool, or lamb's wool, to entry upon payment of the duty of one penny per pound only; and such sheep's wool or lamb's wool so imported, in pursuance of any such orders, shall be subject and liable to the said duty of one penny per pound, and no more, on importation into Great Britain; any thing in this act, or the tables thereto annexed, to the contrary notwithstanding.

That nothing in this act contained shall extend or be construed to extend to alter or repeal any of the rules, regulations, or provisions, contained in 45 Geo. 3. c. 132., and 45 Geo. 3. c. 87., for the warehousing and securing of goods, &c. or in any other act or acts relating to the warehousing, securing, or removal of any such goods, &c. in force in Great Britain immediately before the said 5th of July, 1819, but that all such rules, &c. shall be applied and put in execution for the warehousing and securing of goods, &c. specified in the Table marked F. to this act annexed, and subject to any duties under this act, as fully and effectually, to all intents and purposes, as if the same were repeated and re-enacted in this act (except so far as the same are altered by this act): provided nevertheless, that nothing herein con-

tained shall be construed to extend to permit any goods, &c. to be delivered from any warehouse or place for the purpose of being used or consumed in Great Britain, unless such goods could have been lawfully so delivered, to be used or consumed in Great Britain, before the said 5th of July, 1819.

That from and after the said 5th of July, 1819, it shall and may be lawful to import into Great Britain from the islands of Jersey, Guernsey, or Alderney, and also from Ireland, any WINE whatever, in bottles or flasks, as well for sale as for private use, in packages, each of which shall contain at the least six dozen reputed quart bottles or flasks, on payment of the several and respective duties, as well of customs as excise, due and payable on the importation of such wines into Great Britain; provided that such wines shall be imported in British or Irish built ships or vessels, owned, navigated, and registered, according to law, and in such manner, and under the like rules, regulations, conditions, and restrictions, and shall be subject and liable to the like penalties and forfeitures, as are provided and in force in relation to the importation of French wines, in bottles or flasks, imported into Great Britain. And from and after the said 5th of July, it shall and may be lawful to import into Great Britain, from any parts within the limits of the charter granted to the United Company of Merchants of England, trading to the East Indies, any wine whatever in bottles, on payment of the several and respective duties, as well of customs as excise, due and payable on the importation of such wines into Great Britain: provided always, that the importer of such wine, or his known agent or factor, shall make a declaration before the officer of the customs at the port of importation, stating the nature and quantity of such wine, and that the same is for private use, and not intended to be sold, and that such wine shall be regularly entered and landed under the care of the proper officer of the customs.

And from and after the said 5th of July, it shall be lawful for the commissioners of the customs in England, or any four of them, and for the commissioners of customs in Scotland, or any three of them respectively, to repay or allow to the importers, owners, proprietors, or consignees, of any foreign spirits, wine, or other liquors, which shall be lost by accidental staving on ship-board, or in the unshipping thereof before the landing thereof, the duties of customs which shall have become payable, or shall have been paid, for or in respect of such spirits, wine, &c. and to remit the duties of customs, and to cancel and vacate the customs bond for or in respect of all such spirits, wine, &c. for which no such duties shall have been paid, but for which security shall have been given by bond for the ware-

housing thereof: provided always, nevertheless, that proof shall be made to the satisfaction of the said respective commissioners, that such spirits, wine, or other liquors, were lost by such accidental staving, and not from any want of due care or precaution on the part of the importer, owner, proprietor, or consignee thereof, or his, her, or their agent.

That the duties imposed by this act, and made payable according to the weight, tale, gauge, measure, or value of any goods, wares, or merchandise, shall be charged and payable upon any greater or less weight, number, quantity, or value thereof than the weight, number, quantity, or value particularly inserted, described, and set forth in any of the tables hereunto annexed, in proportion to the actual weight, number, quantity, or value of such goods, wares, or merchandise. And in all cases where by the Tables marked A. and C. to this act annexed, the duties of customs imposed upon the importation or exportation of goods, wares, and merchandise, are charged, not according to the weight, tale, gauge, or measure, but according to the value thereof, such value shall be taken and considered as the same shall be at the port of importation or exportation in Great Britain, without any abatement or deduction whatever, except of so much as the duties payable on the importation or exportation thereof shall amount to; and that such value shall be ascertained by the declaration of the importer, exporter, or proprietor of such goods, wares, or merchandise, so imported or exported, or of his known agent or factor, in such manner and form, and under all such rules, regulations, and provisions, with respect to such declaration, and subject to all such forfeitures and penalties, as are prescribed, directed, and imposed for ascertaining and collecting duties to be paid according to the value thereof, by any act or acts in force in Great Britain immediately before the said 5th of July, 1819. Provided always, that in the case of cotton wool, and the waste of cotton wool, the growth, produce, or manufacture of any place within the limits of the charter granted to the India Company, the duties whereon are payable according to the value thereof, and which hath been or shall be imported by persons other than the said company, and which shall be sold at any sale made by the said company, such value shall be ascertained in like manner and form, and under all such rules, regulations, and provisions, as are prescribed, directed, and imposed for the ascertaining the value of any other goods, wares, or merchandise, sold at such sale; and in the case of any such cotton wool, &c. not sold at any sale made by the said company, the value thereof shall be ascertained in such manner and form, and under all such rules, regu-

lations, and provisions, and subject to such forfeitures and penalties, as are prescribed and imposed for the ascertaining the value of any goods, &c. contained in schedule A. and C. to this act annexed.

And in all cases where by the Table marked B. to this act annexed, the duties of customs imposed on the importation of any goods, wares, and merchandise enumerated in the said table, are charged according to the gross price at which such goods shall be sold at the sales of the East India Company, or according to the value thereof, such price or value respectively shall be ascertained in such manner and form, and under all such regulations and provisions, and subject to such forfeitures and penalties, as are prescribed and imposed for ascertaining the price or value of such goods by any act or acts in force immediately before the said 5th of July, 1819, as if the same were repeated and re-enacted in this act. Provided only, that in estimating the value of British-made SALT exported from Great Britain, it shall and may be lawful for the exporter or proprietor, or his known agent or factor, to deduct so much money from the value of such salt as shall be equal to the amount of the duty of excise paid thereon at the time of the entry of such salt for the purpose of being exported, and the value so ascertained shall be deemed and taken to be the true and real value of such salt at the port of exportation; any thing in this act, or any other act, to the contrary notwithstanding.

That all rules, regulations, conditions, and restrictions, made, established, or directed for the remitting or allowing of any deduction of any duties on account of damage or otherwise, or for the better securing the revenue of customs in Great Britain, or for regulating the importation or exportation of any goods, wares, or merchandise into or from Great Britain, or the bringing or carrying any goods, wares, or merchandise coastwise, or from port to port within Great Britain, or the entering, landing, or shipping of any goods, wares, or merchandise whatever, in Great Britain, and all provisions, clauses, matters, and things relating thereto, contained in any act or acts of parliament in force in Great Britain immediately before the passing of this act, shall be and the same are hereby declared to be and remain in full force and effect, and shall be applied to the subject of this act, and for carrying the same into execution, as fully and effectually to all intents and purposes as if all such were repeated and re-enacted in this present act, except only so far as the same are repealed or altered or otherwise provided for by this act.

That no allowance or abatement shall at any time be made out of or from the duties by this act, and the tables thereto annexed, imposed upon any CURRANTS, FIGS, or RAISINS, for or on account or in respect of any

damage which such currants, figs, or raisins may have sustained in any voyage or otherwise; any law, custom, or usage to the contrary notwithstanding.

That from and after the said 5th of July 1819, if any BROKEN GLASS, fit only to be re-manufactured, shall be imported or brought into Great Britain, all such broken glass, together with the package or packages in which the same shall be found, shall be forfeited, and shall and may be seized by any officer of customs or excise; and all persons importing the same, or aiding or assisting therein, or in the landing, removing, or concealing, or receiving the same, knowing it to have been so imported or brought, shall forfeit and lose the sum of 100*l.*, to be prosecuted, recovered, and applied as other penalties by the laws relating to duties of customs and excise.

That no CHINA or PORCELAIN ware, nor any articles, goods, or wares ornamented with or manufactured wholly or partly of OR MOULU, shall be imported or brought into any port in Great Britain, except at the ports of London, Plymouth, Bristol, Liverpool, Hull, Newcastle, Leith, and Greenock, upon pain of forfeiture of all such articles, goods, or wares aforesaid respectively, together with the chests, cases, and other packages respectively containing such wares respectively; and all such wares, cases, and other packages respectively containing the same, shall and may be seized by any officer or officers of the customs or excise.

That FISH of every kind or sort whatever of British taking and curing, caught or taken in any part of the ocean by the crews of any ships or vessels built in Great Britain or Ireland, or the islands of Jersey, Guernsey, or Man, or in any of the colonies, plantations, islands, or territories which now or at the time of building such ships or vessels did belong, or which may hereafter belong to or be in the possession of his majesty, his heirs or successors, and wholly belonging to and owned by his majesty's subjects, and navigated and registered according to law, shall and may be imported into Great Britain in ships built, owned, navigated, and registered as aforesaid, without payment of any duty of customs whatever; any thing in this act or any other act or acts to the contrary thereof in anywise notwithstanding: provided always, that before such fish shall be admitted to entry, the master or other person having the command of the ship or vessel in which such fish shall be imported, shall make oath before the collector or other chief officer of the customs at the port of importation, that such fish was actually caught, taken, and cured wholly by his majesty's subjects.

That from and after the said 5th of July 1819, before any BLUEBER, TRAIN OIL, SPERMACEI OIL, HEAD MATTER, or WHALE

FiNS, the produce of fish or creatures living in the sea, imported into Great Britain as being taken and caught on the banks and shores of the island of Newfoundland, and parts adjacent, wholly by his majesty's subjects carrying on such fishery from that island, or as being taken and caught wholly by his majesty's subjects usually residing in any of the Bahama or Bermuda islands, or as being taken and caught in the gulph of Saint Lawrence, or on the shores of any British colony or plantation in North America, or the parts adjacent, wholly by his majesty's subjects usually residing in any of the said colonies or plantations, and carrying on such fishery from thence, shall be admitted to entry on payment of the duty imposed on such blubber, train oil, &c. by this act and the table marked A. thereto annexed, the master or other person having or taking the charge or command of the vessel in which the same shall be imported, shall deliver to the collector or other chief officer of the customs at the port of importation, a certificate under the hand and seal of the governor or deputy governor of Newfoundland, or of such other British colony or plantation, or of the collector or other chief officer of the customs of the port or place in Newfoundland, or in such other British colony or plantation where such train oil, blubber, &c. shall have been taken on board, or if no such governor or deputy governor, or collector or other chief officer of the customs shall be residing there, then a certificate shall be produced under the hand and seal of the naval officer or other principal officer of such port or place, or of one of his majesty's justices of the peace for the district, testifying that oath had been made before him by the shipper of such blubber, train oil, &c., that the same was really and *bonâ fide* the produce of fish or creatures living in the sea, actually caught and taken wholly by his majesty's subjects carrying on such fishery, and usually residing in the said island of Newfoundland, or in his majesty's European dominions, or by his majesty's subjects usually residing in such other British colony or plantation, and carrying on such fishery from thence; and the master or other person having or taking the charge or command of the vessel in which the blubber or train oil shall be imported into Great Britain, shall make oath before the collector or other chief officer at the port of importation, that the blubber, train oil, &c. so imported, is the same as mentioned and referred to in the said certificate; and the importer or consignee of such blubber, train oil, &c. shall also make oath before the collector or comptroller, or other proper officer of the customs, at the time of entry, that to the best of his or their knowledge and belief the blubber, train oil, &c. so imported was actually caught and

taken by British subjects usually residing in the island of Newfoundland, or in his majesty's European dominions, or by his majesty's subjects usually residing in such other British colony or plantation, and carrying on such fishery from thence; and on failure of such certificate being produced, and proof on oath as aforesaid being made, such blubber, train oil, &c. shall be deemed and taken to be of foreign fishing, and shall be charged with the duty imposed by this act, and the table marked A. thereto annexed, on such articles of foreign fishery. But the payment of the several duties of customs by this act imposed on the importation of such oil, &c. taken and caught as aforesaid, and also the duties payable on CRANBERRIES, FOX SKINS, OTTER SKINS, SEAL SKINS, WOLF SKINS, BEAR SKINS, CAT SKINS, BEAVER SKINS, AND ON TIMBER, being the produce of Newfoundland, and imported directly from thence, as the same are respectively described and set forth in figures in the table marked A. annexed to this act, shall be suspended, and the said duties shall not be charged or payable on any such articles so imported, until the 5th of July 1824 inclusive, and also, that the duty by this act imposed on goods, wares, and merchandise exported from Great Britain to the said island of Newfoundland, as described and set forth in the table hereunto annexed marked C., and also the tonnage duties payable on ships or vessels entering inwards or outwards from or to the said island of Newfoundland in any port of Great Britain, as set forth in the table hereunto annexed marked E., shall be in like manner suspended, and shall not respectively be charged or payable until the 5th of July 1824, inclusive; any thing in this act to the contrary notwithstanding: provided always, that such goods, wares, and merchandise shall be duly entered and landed, and shall be subject in every respect to all the regulations required by law.

That the several duties of **TONNAGE** imposed by this act, as described in the table hereto annexed marked E., on ships and vessels entering outwards or inwards to or from foreign parts, shall be paid to the proper officer of the customs; and that no officer of the customs whatsoever, or any deputy or clerk of such officer, shall permit or suffer any ship or vessel to break bulk, or any part of her cargo to be discharged; nor shall issue any order nor grant any document for the unshipping or landing any goods, wares, or merchandise brought or imported by any ship or vessel, subject and liable to the payment of the duties of tonnage, until the said duties have been fully paid to the proper officer of the customs; or in case any doubt or dispute shall arise as to the true tonnage thereof, so that a perfect entry cannot be passed, then in every such case a

sufficient deposit shall be made of the said duties with such officer as aforesaid, previous to any document being issued or granted for the unshipping or landing any part of the cargo of such ship or vessel so entering inwards as aforesaid; any law, or usage to the contrary notwithstanding; and the said duties shall be paid on every report inwards, and on every entry outwards of each and every ship and vessel, for each and every voyage which any such ship or vessel shall so report inwards or enter outwards at any port within Great Britain; and the tonnage of every such ship or vessel, being British-built or British-owned, shall be computed and taken according to the register thereof in Great Britain, under the provisions of 26 Geo. 3. c. 60. and the tonnage of every other ship or vessel, in case of any doubt or dispute relative thereto, shall be ascertained in Great Britain by admeasurement, in the mode and manner prescribed and directed by the said act: provided always, that nothing herein contained shall be construed to extend to alter or repeal any of the regulations contained in 56 Geo. 3. c. 9. respecting foreign packets or passage vessels entering or departing in any of the ports of Great Britain; but that all such regulations shall be applied to the duties on such packets, &c. specified and set forth in the table to this act annexed, marked E.

But nothing in this act contained shall be construed to extend to charge with the duty of tonnage imposed by this act, and the table marked E., any ship or vessel employed in the fisheries on any part of the coast of Great Britain, and not entering outwards for foreign parts, or any ship or vessel employed in bringing oysters from Jersey or Guernsey into any port in Great Britain, or to charge the said tonnage duty on any British or Irish built ship or vessel owned by British subjects, which is not required to be registered by any act of parliament in force in Great Britain or Ireland respectively, on or immediately before the said 5th of July, 1819, or on any ship or vessel whatsoever which shall enter outwards or inwards in ballast only; any thing in this act, or in the table marked E. to the contrary notwithstanding.

That the DRAWBACKS granted, allowed, and made payable upon goods, wares, and merchandise exported from Great Britain under or by virtue of any act or acts in force in Great Britain immediately before the said 5th of July, 1819, shall remain and continue payable with respect to such goods, wares, &c. which, having paid the duties imposed on the importation thereof by any act or acts in force immediately before the said 5th of July, shall, after the said 5th, be exported from Great Britain; and that the several and respective drawbacks, inserted,

specified, and set forth in the tables to this act annexed, marked A. B. and D., shall be paid and allowed only on the exportation of such articles as shall have paid the duties imposed thereon by this act and the said tables thereto annexed.

That from and after the 5th of July, 1819, such drawback as is mentioned, specified, and set forth in the table or schedule marked B. to this act annexed, shall be allowed in respect of THROWN SILK exported from Great Britain, which shall be thrown in Great Britain from a larger quantity of raw silk imported into Great Britain from any place within the limits of the charter granted to the India Company: provided always, that oath be first made before the collector of the customs at the port of exportation by the throwster of such thrown silk, that the said thrown silk was produced solely from raw silk which had been so imported into Great Britain, and for which his majesty's customs and duties had been duly paid, and that the same was duly exported; his majesty's searcher also certifying the shipping thereof, and all such other requisites being duly performed as are necessary to be done and performed with regard to raw silk exported from Great Britain.

That no drawback of the duties of customs or excise shall be allowed on any WINE whatever which shall be exported or shipped for exportation from Great Britain after the said 5th of July, other than on wine in bottles which shall be shipped in packages each containing six dozen reputed quart bottles at the least: provided always, that nothing in this act contained shall be construed to extend to repeal or discontinue any drawback of the duties of customs on any sort of wine intended for the use of admirals, captains, and other commissioned officers serving in any of his majesty's ships of war, or for the use of commissioned officers of the royal marines, or of persons acting as such, for their consumption on board of such of his majesty's ships as they shall serve in, by any acts of parliament in force in Great Britain on or immediately before the said 5th of July, 1819.

That from and after the said 5th of July, 1819, such drawback as is mentioned, specified, and set forth in the table or schedule marked A. to this act annexed, shall be allowed in respect of any BRIMSTONE which shall be refined in Great Britain from a larger quantity imported rough, and shall be exported from thence upon oath being first made by the refiner thereof, before the collector of the customs at the port of exportation, that the said refined brimstone was produced solely from brimstone which had been imported into Great Britain unrefined, and for which his majesty's customs and duties had been duly paid, and that the same was duly exported; his majesty's

searcher also certifying the shipping thereof, and all such other requisites being duly performed as are necessary to be done and performed with regard to brimstone unrefined exported from Great Britain. And from and after the said 5th of July, a drawback of nine-tenths, and no more, of all such duties on importation as shall have been paid on any foreign brimstone, shall be allowed in respect of all such foreign brimstone as at any time after the said 5th of July, shall be used and consumed in Great Britain in making and preparing oil of vitriol; any thing in any act of parliament in force immediately before the said 5th of July to the contrary notwithstanding; and the amount of such drawback shall be ascertained, and paid and allowed to the manufacturers of such oil of vitriol, under the regulations and restrictions contained in an act of 50 Geo. 3. c. 40., and under and subject to the like penalties upon any manufacturer of such oil for delivering any false accounts in respect of foreign brimstone used and consumed in his manufactory, with intent to defraud his majesty, as are contained in the said act.

That from and after the 5th day of July, 1819, for all COALS used for any purpose relating to the carrying on the works for the manufacturing of tin plates at Pennygored, in the county of Pembroke, called the Pennygored Works, for which the duties granted by this act shall have been duly paid, a drawback shall be allowed of all such duties, not exceeding the sum of one thousand pounds in any one year: provided always, that the said drawback shall be paid upon the proofs and under the conditions required by an act 35 G. 3. c. 39. for allowing a drawback of the duties upon coals used in carrying on the said Pennygored works.

That from and after the said 5th of July, 1819, for all coals which shall be used in calcining or smelting copper or lead ore within the Isle of Anglesey, or which shall be used in fire-engines for draining water out of the mines of copper and lead within the said isle, for which the duties granted by this act shall have been duly paid, a drawback shall be allowed of all such duties: provided always, that the said drawback shall be paid upon the proofs required by an act 26 Geo. 3. c. 104. for allowing a

drawback of the duties upon coals used in smelting copper, &c., and in fire-engines for draining water out of the mines, within the said isle.

That from and after the said 5th of July, 1819, a drawback of the whole duty specified in table D. to this act annexed, on STONE the production of Great Britain, brought coastwise from any port or place in Great Britain to any other port or place therein, shall be allowed in respect of such stone as at any time after the said 5th of July, shall be used and employed in Great Britain in making *barn floors*; and that the amount of such drawback shall be allowed to the person by whom such stone was used and employed, upon proof to the satisfaction of the commissioners of the customs that such duty was paid, and that such stone was so used and employed for such purpose as aforesaid: also a drawback of the duty specified in the said table D. on stone the production of Great Britain brought in like manner, shall be re-paid in respect of such stone as at any time after the said 5th of July, shall be used and employed in Great Britain in paving *streets and public ways* upon proof of the actual payment of such duty, and under such conditions, regulations, and restrictions, as shall from time to time be directed and made by the commissioners of his majesty's treasury of the united kingdom of Great Britain and Ireland, or any three of them, for that purpose.

That if any action or suit shall be brought or commenced against any person for any thing done in pursuance of this act, such action or suit shall be commenced within three calendar months next after the fact committed, and not afterwards, and shall be laid in the county or place where the cause of complaint did arise, and not elsewhere; and the defendant in every such action or suit may plead the general issue, and give this act and the special matter in evidence, at any trial to be had thereupon; and if the jury shall find for the defendant, or if the plaintiff shall be nonsuited, or discontinue his action or suit after the defendant shall have appeared, or if, upon demurrer, judgment shall be given against the plaintiff, the defendant shall have treble costs.

TABLES REFERRED TO IN THIS ACT.

TABLE (A).

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise IMPORTED into Great Britain from Foreign Parts (except Goods, Wares, and Merchandise of the Growth, Produce, or Manufacture of any Place within the Limits of the Charter granted to the United Company of Merchants of England trading to the East Indies, and Goods imported from His Majesty's Settlement of the Cape of Good Hope, and the Territories and Dependencies thereof); and of the Drawbacks to be allowed on the Exportation of such Goods, Wares, and Merchandise.

TABLE (B).

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise, being of the Growth, Produce, or Manufacture of any Place within the Limits of the Charter granted to the United Company of Merchants of England trading to the East Indies IMPORTED into Great Britain; and on Goods, Wares, and Merchandise IMPORTED into Great Britain from His Majesty's Settlement of the Cape of Good Hope, and the Territories and Dependencies thereof; and of the Drawbacks to be allowed on the Exportation of such Goods, Wares, and Merchandise.

TABLE (C).

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise EXPORTED from Great Britain.

TABLE (D).

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise brought or carried COASTWISE from one Port or Place to any other Port or Place within Great Britain; and of the Drawbacks to be allowed on the Exportation thereof from Great Britain.

TABLE (E).

A TABLE of the TONNAGE DUTIES of CUSTOMS payable on Ships or Vessels entering INWARDS or OUTWARDS (except in ballast) in any Port of Great Britain from or to Foreign Parts.

TABLE (F).

LISTS of ARTICLES which may be LODGED in WAREHOUSES, or otherwise secured, at approved Ports in Great Britain, under the Rules, Regulations, and Securities required by Law, without Payment, at the Time of the First Entry, of the Duties due on the Importation thereof.

TABLE (A).

A TABLE of the DUTIES of CUSTOMS payable on Goods, Wares, and Merchandise IMPORTED into Great Britain from Foreign Parts (except Goods, Wares, and Merchandise of the Growth, Produce, or Manufacture of any Place within the Limits of the Charter granted to the United Company of Merchants of England trading to the East Indies, and Goods imported from His Majesty's Settlement of the Cape of Good Hope, and the Territories and Dependencies thereof); and of the Drawbacks to be allowed on the Exportation of such Goods, Wares, and Merchandise.

Corn, viz.			
All Corn, Meal, or Flour, the growth, produce or manufacture of any foreign country, which may by law be imported into Great Britain, may at all times be brought into, and warehoused therein, without payment of any duty whatever, and such Corn, Meal, or Flour having been so warehoused, may at all times be taken out of such warehouse, and exported according to law, without payment of any duty whatever; and any such Corn, Meal, or Flour, may be taken out of such warehouse and entered for home consumption in Great Britain, under the regulations and provisions required by law, without payment of any duty whatever, whenever foreign Corn, Meal, or Flour of the same sort may by law be admissible into Great Britain for home consumption. See 55 Geo. 3. c. 26.			
Foreign Corn, Meal, or Flour may be imported into Great Britain for home consumption, under and subject to the provisions and regulations in force, without payment of any duty whatever, whenever the average prices of the several sorts of British Corn, made up and published as required by law, shall be at or above the prices hereafter mentioned, viz. Whenever Wheat shall be at or above the price of eighty shillings per quarter; whenever Rye, Pease, and Beans shall be at or above the price of fifty-three shillings per quarter; whenever Barley, Beer, or Big shall be at or above the price of forty shillings per quarter; and whenever			

TABLE (A.) INWARDS.

	Duty.	Drawback.
	£. s. d.	£. s. d.
Corn— <i>continued.</i>		
Oats shall be at or above the price of twenty-seven shillings per quarter. See 55 Geo. 3. c. 26.		
Whenever the average prices of British Corn, so made up and published, shall respectively be below the prices before stated, no foreign Corn, or Meal or Flour made from any of the respective sorts of foreign Corn before enumerated, shall be allowed to be imported into Great Britain for the purpose of home consumption, or taken out of warehouse for that purpose. See 55 Geo. 3. c. 26.		
The average price of the several sorts of British Corn by which the importation of foreign Corn, Meal, or Flour into Great Britain shall be regulated and governed, shall continue to be made up and published in the manner required by law, (See 31 Geo. 3. c. 30., 33 Geo. 3. c. 65., 44 Geo. 3. c. 109., 45 Geo. 3. c. 86.) ; but if at any time after the importation of foreign Corn, Meal, or Flour, shall be permitted under the provisions required by law, it shall appear that the average prices of the different sorts of British corn respectively, in the six weeks immediately succeeding the 15th of February, the 15th of May, the 15th of August, and the 15th of November, in each year, have fallen below the prices at which foreign Corn, Meal, or Flour, may be by law allowed to be imported for home consumption, no such foreign Corn, Meal, or Flour, shall be allowed to be imported into Great Britain for home consumption from any place between the rivers Eyder and Bidassoa, both inclusive, until a new average shall be made up and published in the London Gazette, for regulating the importation into Great Britain for the succeeding quarter. See 55 Geo. 3. c. 26.		
Any Corn, Meal, or Flour, being the growth, produce, or manufacture, of any British colony or plantation in North America, which may by law be imported into Great Britain, may respectively be imported for home consumption without payment of any duty, whenever the average prices of British Corn, made up and published as by law required, shall respectively be at or above the prices hereafter specified, <i>viz.</i> whenever the price of wheat shall be at or above 67s. per quarter; whenever the price of rye, pease, and beans, shall be at or above 44s. per quarter; whenever the price of barley, beer, or bigg, shall be at or above 33s. per quarter; and whenever the price of oats shall be at or above 22s. per quarter. See 55 Geo. 3. c. 26.		
Whenever the prices of British Corn respectively shall be below the prices before specified, Corn, or Meal or Flour made from any of the respective sorts of Corn herein-before enumerated, being of the growth, produce, or manufacture, of any British colony or plantation in North America, shall no longer be allowed to be imported into Great Britain for home consumption. See 55 Geo. 3. c. 26.		
Any Corn, Meal, or Flour, being of the growth, produce, or manufacture, of any British colony or plantation in North America, which may by law be imported into Great Britain, may at all times be permitted to be so imported and warehoused according to law, without payment of any duty whatever, and be taken out of such warehouse, and exported according to law without payment of any duty whatever. See 55 Geo. 3. c. 26.		

TABLE (A.)—INWARDS.

Coals— <i>continued</i> .		
ceeding 50,000 tons in the whole, may be brought within one year, by the Grand Junction and Paddington Canals to London on payment of the following duty, see 45 Geo. 3. c. 128., <i>viz.</i>		
For every ton of Coals so brought - -	0 7 6	—
A further duty of 1s. 3d. per ton on Coals so brought is also payable to the proper officer of the customs, and at the end of every quarter is to be paid to the corporation of London, in lieu of the duty called Orphan's Duty, and of all other rates, dues, and duties, payable to that corporation upon Coals imported into the port of London.		
— Coals brought down the river Thames nearer to London than the city's stone placed on the west side of Staines bridge, in the county of Middlesex, and on which the coast duties shall not have been paid, the ton -	0 10 0	—
A further duty of 1s. 3d. per ton on Coals so brought is also payable to the proper officer of the customs, and at the end of every quarter is to be paid to the corporation of London, in lieu of the duty called Orphan's Duty, and of all other rates, dues, and duties payable to that corporation upon Coals imported into the port of London.		
For the conditions, rules, and regulations under which Coals may be so brought, and such duties received, see 50 Geo. 3. c. 110.		
— Coals laden on board any ship or vessel cleared coastwise at any port in England or Wales, and delivered in any part beyond the sea, before the duties due on the exportation thereof shall have been paid, the master of such ship or vessel shall not be permitted again to enter or clear the said ship or vessel coastwise, or for parts beyond the seas, before he shall have paid not only the export duties on the greatest quantity of coals which it shall appear the vessel is capable of containing, but also the further sum of 3s. for every such chaldron of coals, Winchester measure, to be applied and appropriated to the same uses with the respective duties payable on Coals exported.		
For the conditions, regulations, and restrictions, under which such duty of 3s. the chaldron may be returned, see 52 Geo. 3. c. 9.		
— Coals shipped coastwise at any port in Scotland, and delivered in any part beyond the seas, before the duties due on the exportation thereof shall have been paid, the master of the vessel shall not be permitted again to enter or clear out at any port in Great Britain until he shall have paid not only the duties due on the exportation of such Coals, but in addition thereto for every chaldron thereof so entered coastwise, Winchester measure - -	0 3 0	—
For the conditions, regulations, and restrictions under which the said duty of three shillings the chaldron shall be repaid, see 25 Geo. 3. c. 54.		
— Coals (except charcoal made of wood) brought coastwise from any port in Great Britain into any other port in England or Wales (except the port of London, and also except coals brought or carried coastwise within the principality of Wales, until 1st August 1820) <i>viz.</i>		
..... in case they are such as are most usually sold by weight, the ton containing 20 cwt. - -	0 4 0	0 3 8

Coals, &c.— <i>continued.</i>		
..... in case they are such as are most usually sold by measure, the chaldron Winchester measure.	0 6 0	0 5 6
— Coals sent coastwise from the port of Newcastle-upon-Tyne to any other port in Great Britain, the chaldron Newcastle measure	0 1 0	—
For the conditions, regulations, and restrictions under which the duties on coals brought coastwise, or from any port or place to any other port or place within England may be secured by bond, see 27 Geo. 3. c. 32.		
For the conditions, regulations, and restrictions under which coals may be carried from Ellenfoot to Bank End in the county of Cumberland, or from any creek or place to any other creek or place between Ellenfoot and Bank End aforesaid, without payment of any duty of customs, see 8 Geo. 1. c. 14.		
— Coals carried from any part of the Lancaster Canal, or any of the branches thereof, or from any part or place within the hundred of Lonsdale in the county of Lancaster into the Ulverstone Canal, across or along the bay or estuary separating the two canals, are not liable to any duty of customs.		
For the conditions, regulations, and restrictions under which coals may be carried on the Monmouthshire Canal, and afterwards carried or conveyed from any port or place to the eastward of the islands called the Holmes, to any other port or place in or upon the river Severn, also to the eastward of the said islands, without passing to the westward thereof, without payment of duty, see 37 Geo. 3. c. 100.		
And for the conditions, regulations, and restrictions under which coals may be carried or conveyed on the Monmouthshire Canal, or on any of the railways or tram-roads connected therewith, and afterwards carried to the port of Bridgwater only by a passage to the westward of the islands called the Holmes, notwithstanding the restrictions before mentioned, without payment of duty, see 42 Geo. 3. c. 115. of the Public Local and Personal Acts.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the duties on coals used for melting copper and tin ores within the counties of Cornwall and Devon, see 9 Ann. c. 6.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the duties on coals which shall be used in fire-engines for draining water out of the mines of tin and copper within the county of Cornwall, see 14 Geo. 2. c. 41.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the duties paid on all coals that shall be used for fire-engines in mines of tin, copper, or lead, or for calcining or smelting lead ores, within the county of Devon, see 51 Geo. 3. c. 83.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the duties paid on all coals consumed in fire or steam engines used for the purpose of drawing or raising ores, or dead stuff or rubbish, out of the mines of tin, copper, or lead in the counties of Cornwall and Devon, see 53 Geo. 3. c. 18.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed and made of all the duties that have been paid on any coals used for fire-engines in mines of lead, or for calcining or smelting		

TABLE (D.)—COASTWISE.	Duty.	Drawback.
Coals, &c. — <i>continued.</i>	£. s. d.	£. s. d.
lead ores, within the county of Cornwall, see 56 Geo. 3. c. 134.		
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the duties on coals used in calcining or smelting copper and lead ores, within the Isle of Anglesey, or which shall be used in fire-engines for draining water out of the mines of copper and lead within the said Isle, see 26 Geo. 3. c. 104. and the Abstract of the Act to which this Table is annexed.		
For the conditions, regulations, and restrictions under which all the duties on coals used for any purpose relating to the carrying on the works for the manufacturing of tin plates, and for other purposes at Pennygored in the county of Pembroke, called the Pennygored Works, shall be repaid, provided the amount thereof shall not exceed £1000. in any one year, see 25 Geo. 3. c. 39.		
— Coals (except charcoal made of wood) brought or carried coastwise to any port within the principality of Wales, until the 1st August 1820, <i>viz.</i>		
..... in case they are such as are most usually sold by weight, the ton containing 20 cwt. - -	0 0 9	—
..... in case they are such as are most usually sold by measure, the chaldron Winchester measure	0 1 0	—
For the conditions, regulations, and restrictions under which a drawback shall be allowed of all the above duties on coals used for any purpose relating to the carrying on the works for the manufacturing of tin plates at Pennygored in the county of Pembroke, called the Pennygored Works, such drawback not exceeding the sum of £1000. in any one year, see the Abstract of the Act to which this Table is annexed.		
For the conditions, regulations, and restrictions under which the above duties on all coals which shall be used in calcining or smelting copper or lead ore, within the Isle of Anglesey, or which shall be used in fire-engines for draining water out of the mines of copper or lead within the said Isle, shall be repaid, see the Abstract of the Act to which this Table is annexed.		
<i>Note.</i> —Coals brought coastwise to any port or place within the principality of Wales, on and after the 1st August 1820, will be subject and liable to such and the like duties as now are, or then may be payable on coals brought coastwise into any port of England, except the port of London. See the Abstract of the Act to which this Table is annexed.		
— Culm brought coastwise from any port or place in Great Britain into the port of London, the chaldron Winchester measure - - -	0 5 0	0 1 5
For the conditions, regulations, and restrictions under which a quantity of coals, culm, and cinders, not exceeding 50,000 tons in the whole, may be brought within one year by the Grand Junction and Paddington Canals to London on payment of the following duty, see 45 Geo. 3. c. 128. <i>viz.</i>		
For every Ton of Culm so brought - -	0 7 6	—
A further duty of 1s. 3d. per ton on Culm so brought is also payable to the proper officer of the customs, and at the end of every quarter is to be paid to the corporation of London in lieu of the duty called Orphan's Duty, and of all other rates, dues, and duties payable to that corporation upon Culm imported into the port of London.		

TABLE (D.)—COASTWISE.	Duty.	Drawback.
Coals, &c. — <i>continued.</i>	£. s. d.	£. s. d.
— Culm brought down the river Thames nearer to London than the city's stone placed on the west side of Staines Bridge, in the county of Middlesex, and on which the coast-duties shall not have been paid, the ton -	0 10 0	—
A further duty of 1s. 3d. per ton on culm so brought, is also payable to the proper officer of the customs, and at the end of every quarter is to be paid to the corporation of London in lieu of the duty called Orphan's Duty, and of all other rates, dues, and duties payable to that corporation upon culm imported into the port of London.		
For the conditions, rules, and regulations under which culm may be so brought, and such duties received, see 50 Geo. 3. c. 110.		
— Culm laden on board any ship or vessel cleared coastwise at any port in England or Wales, and delivered in any part beyond the sea, before the duties due on the exportation thereof shall have been paid, the master of such ship or vessel shall not be permitted again to enter or clear the said ship or vessel coastwise, or for parts beyond the seas, before he shall have paid not only the export duties on the greatest quantity of Culm which it shall appear the vessel is capable of containing, but also the further sum of 3s. for every such chaldron of culm, Winchester measure, to be applied and appropriated to the same uses with the respective duties payable on Culm exported.		
For the conditions, regulations, and restrictions under which such duty of 3s. the chaldron may be returned, see 52 Geo. 3. c. 9.		
— Culm shipped coastwise at any port in Scotland and delivered in any part beyond the seas, before the duties due on the exportation thereof shall have been paid, the master of the vessel shall not be permitted again to enter or clear out at any port in Great Britain, until he shall have paid not only the duties due on the exportation of such Culm, but in addition thereto, for every chaldron thereof so entered coastwise, Winchester measure -	0 3 0	—
For the conditions, regulations, and restrictions under which the said duty of 3s. the chaldron shall be repaid, see 25 Geo. 3. c. 54.		
— Culm to be used for the burning of Lime, carried from any place within the limits of the port of Milford in the county of Pembroke, to any other place within the counties of Pembroke, Carmarthen, Cardigan, or Merioneth, the chaldron, Winchester measure -	0 1 3	—
For the conditions, regulations, and restrictions under which culm may be so carried, on payment of the above duty, see 33 Geo. 2. c. 15.		
— Culm, brought coastwise from any port in Great Britain into any other port in England or Wales, except the port of London, and except Culm carried from Milford as before-mentioned, and also except Culm brought or carried coastwise within the principality of Wales, until the 1st August 1820, the chaldron, Winchester measure -	0 1 3	0 1 2
— Culm carried from any part of the Lancaster canal, or any of the Branches thereof, or from any part or place within the hundred of Lonsdale in the county of Lancaster into the Ulverstone canal, across or along the bay or estuary separating the two canals, are not liable to any duty of customs.

Stones, may be entered without payment of duty, see 34 Geo. 3. c. 51. and 39 and 40 Geo. 3. c. 51.		
For the conditions, regulations, and restrictions under which the duty on Stones that have been used in making barn floors, may be repaid, see the Abstract of the Act, to which this Table is annexed.		

TABLE (E.)

A TABLE of the TONNAGE DUTIES of CUSTOMS payable on Ships or Vessels entering INWARDS or OUTWARDS (except in Ballast) in any Port of Great Britain from or to Foreign Parts.

TABLE (E.)—TONNAGE:	Duty.
	£. s. d.
Tonnage Duty on Ships and Vessels entering inwards or outwards (except in ballast) in any port of Great Britain from or to foreign parts, <i>viz.</i>	
For every ton burthen of every Ship or Vessel entering inwards or outwards (except in ballast) from or to the islands of Guernsey, Jersey, Sark, or Alderney, the Greenland Seas, the Southern whale-fishery, the islands of Newfoundland, Cape Breton, St. John, or Prince Edward's Island, or the coast of Labrador	0 0 6
For the suspension of this duty, as far as it relates to Ships and Vessels entering inwards or outwards in any port of Great Britain from or to the island of Newfoundland, until the 5th July 1824, see the Abstract of the Act, to which this Table is annexed.	
For every ton burthen of every Ship or Vessel entering inwards or outwards (except in ballast) from or to the Cape of Good Hope	0 2 6
For every ton burthen of every Ship or Vessel entering inwards or outwards (except in ballast) from or to any port or place within the limits of the charter granted to the United Company of Merchants of England trading to the East Indies, except the Cape of Good Hope	0 3 0
For every ton burthen of every Ship or Vessel entering inwards or outwards (except in ballast) from or to any port or place not otherwise enumerated or described, except the Isle of Man	0 2 0
For every ton burthen of every Packet or Passage-vessel belonging to the subjects of his most christian majesty, which shall lade or unlade any goods, wares, or merchandize, or take in or set on shore any passengers, in any port, creek, harbour, or road of Great Britain, except any Ship or Vessel used only for the purposes of pleasure, and which shall not carry any goods, wares, or merchandise, or any passengers, for hire or reward	0 3 6
<i>Note.</i> — His majesty is empowered by his royal proclamation or proclamations, issued by and with the advice of his privy council, or by his majesty's order or orders in council to be published from time to time in the London Gazette, to direct such duty or duties as shall be therein specified, to be levied, collected, and paid in the ports of Great Britain, on the entering or clearing out of the Packets or Passage-vessels of such foreign countries as shall be named in the said proclamations or orders in council, and from time to time, by any such proclamations or orders in council issued or published as aforesaid, to revoke, diminish, or increase such duties to the same amount as similar duties may be respectively revoked, diminished, or increased on British Packets or Passage-vessels entering or clearing out from the ports or harbours of such foreign countries. But no such proclamations
